Abstract

In this report, we consider a theory of gravity with a metric-dependent torsion namely the $F(R,T)$ gravity, where $R$ is the curvature scalar and $T$ is the torsion scalar. We study the geometric root of such theory. In particular we give the derivation of the model from the geometrical point of view. Then we present the more general form of $F(R,T)$ gravity with two arbitrary functions and give some of its particular cases. In particular, the usual $F(R)$ and $F(T)$ gravity theories are particular cases of the $F(R,T)$ gravity. In the cosmological context, we find that our new gravitational theory can describe the accelerated expansion of the Universe.

1 Introduction

In the last years the interest in modified gravity theories like $F(R)$ and $F(G)$-gravity as alternatives to the ΛCDM Model grew up. Recently, a new modified gravity theory, namely the $F(T)$-theory, has been proposed. This is a generalized version of the teleparallel gravity originally proposed by Einstein [13]-[24]. It also may describe the current cosmic acceleration without invoking dark energy. Unlike the framework of GR, where the Levi-Civita connection is used, in teleparallel gravity (TG) the used connection is the Weitzenböck’one. In principle, modification of gravity may contain a huge list of invariants and there is not any reason to restrict the gravitational

*Email: rmyrzakulov@gmail.com; rmyrzakulov@csufresno.edu
theory to GR, TG, $F(R)$ gravity and/or $F(T)$ gravity. Indeed, several generalizations of these theories have been proposed (see e.g. the quite recent review [9]). In this paper, we study some other generalizations of $F(R)$ and $F(T)$ gravity theories. At the beginning, we briefly review the formalism of $F(R)$ gravity and $F(T)$ gravity in Friedmann-Robertson-Walker (FRW) universe. The flat FRW space-time is described by the metric
\begin{equation}
    ds^2 = -dt^2 + a^2(t)(dx^2 + dy^2 + dz^2),
\end{equation}
where $a = a(t)$ is the scale factor. The orthonormal tetrad components $e_i(x^\mu)$ are related to the metric through
\begin{equation}
    g_{\mu\nu} = \eta_{ij} e^i_\mu e^j_\nu,
\end{equation}
where the Latin indices $i, j$ run over 0...3 for the tangent space of the manifold, while the Greek letters $\mu, \nu$ are the coordinate indices on the manifold, also running over 0...3.

$F(R)$ and $F(T)$ modified theories of gravity have been extensively explored and the possibility to reach a more realistic representation of the gravitational fields near curvature singularities and to create some first order approximation for the quantum theory of gravitational fields. Recently, it has been registered a renaissance of $F(R)$ and $F(T)$ gravity theories in the attempt to explain the late-time accelerated expansion of the Universe [9].

**PROBLEM:**

Construct such $F(R, T)$ gravity which contents $F(R)$ gravity and $F(T)$ gravity as particular cases.

In the modern cosmology, in order to construct (generalized) gravity theories, three quantities – the curvature scalar, the Gauss–Bonnet scalar and the torsion scalar – are usually used (about particular cases).

\begin{align}
    R_s &= g^\mu\nu R_{\mu\nu}, \\
    G_s &= R^2 - 4R^\mu\nu R_{\mu\nu} + R^{\mu\nu\rho\sigma} R_{\mu\nu\rho\sigma}, \\
    T_s &= S^\mu\nu T_{\mu\nu}.
\end{align}

In this paper, our aim is to replace these quantities with the other three variables in the form
\begin{align}
    R &= u + g^\mu\nu R_{\mu\nu}, \\
    G &= w + R^2 - 4R^\mu\nu R_{\mu\nu} + R^{\mu\nu\rho\sigma} R_{\mu\nu\rho\sigma}, \\
    T &= v + S^\mu\nu T_{\mu\nu},
\end{align}
where $u = u(x; g_1, g_j, g_{ij}, ..., f_j)$, $v = v(x; g_1, g_j, g_{ij}, ..., g_j)$ and $w = w(x; g_1, g_j, g_{ij}, ..., h_j)$ are some functions to be defined. As a result, we obtain some generalizations of the known modified gravity theories. With the FRW metric ansatz the three variables (1.3)-(1.5) become
\begin{align}
    R_s &= 6(\dot{H} + 2H^2), \\
    G_s &= 24H^2(\dot{H} + H^2), \\
    T_s &= -6H^2,
\end{align}
where $H = (\ln a)_t$. In the contrast, in this paper we will use the following three variables
\begin{align}
    R &= u + 6(\dot{H} + 2H^2), \\
    G &= w + 24H^2(\dot{H} + H^2), \\
    T &= v - 6H^2.
\end{align}
Finally we would like to note that we expect $w = w(u, v)$. This paper is organized as follows. In Sec. 2, we briefly review the formalism of $F(R)$ and $F(T)$-gravity for FRW metric. In particular,
2 Preliminaries of $F(R)$, $F(G)$ and $F(T)$ gravities

At the beginning, we present the basic equations of $F(R)$, $F(T)$ and $F(G)$ modified gravity theories. For simplicity we mainly work in the FRW spacetime.

2.1 $F(R)$ gravity

The action of $F(R)$ theory is given by

$$S_R = \int d^4x e [F(R) + L_m],$$

where $R$ is the curvature scalar. We work with the FRW metric (1.1). In this case $R$ assumes the form

$$R = R_s = 6(\dot{H} + 2H^2).$$

The action we rewrite as

$$S_R = \int dt L_R,$$

where the Lagrangian is given by

$$L_R = a^3(F - RF_R) - 6F_R \dot{a}^2 - 6F_{RR} \dot{a} \dot{a}^2 - a^3 L_m.$$ (2.4)

The corresponding field equations of $F(R)$ gravity read

$$6 \dot{R} F_{RR} - (R - 6H^2)F_R + F = \rho,$$ (2.5)

$$-2\dot{R}^2 F_{RRR} + [-4\dot{R}H - 2\dot{R}]F_{RR} + [-2H^2 - 4a^{-1}\ddot{a} + R]F_R - F = p,$$ (2.6)

$$\dot{\rho} + 3H(\rho + p) = 0.$$ (2.7)

2.2 $F(T)$ gravity

In the modified teleparallel gravity, the gravitational action is

$$S_T = \int d^4x e [F(T) + L_m],$$

where $e = \det(e^i_\mu) = \sqrt{-g}$, and for convenience we use the units $16\pi G = \hbar = c = 1$ throughout. The torsion scalar $T$ is defined as

$$T \equiv S_\rho^{\mu\nu} T^{\rho}_{\mu\nu},$$ (2.9)

where

$$T^{\rho}_{\mu\nu} \equiv -e^\theta_i (\partial_\mu e^i_\nu \dot{e}^\theta_{\rho} - \partial_\nu e^i_\rho \dot{e}^\theta_{\mu}),$$ (2.10)

$$K^{\mu\nu}_{\rho} \equiv -\frac{1}{2} (T^{\mu\nu}_{\rho} - T^{\nu\mu}_{\rho} - T^{\rho}_{\mu\nu}),$$ (2.11)

$$S_\rho^{\mu\nu} \equiv \frac{1}{2} (K^{\mu\nu}_{\rho} + \delta^\mu_\rho T^{\theta\nu}_{\theta} - \delta^\nu_\rho T^{\theta\mu}_{\theta}).$$ (2.12)

For a spatially flat FRW metric (1.1), as a consequence of equations (3.9) and (1.1), we have that the torsion scalar assumes the form

$$T = T_s = -6H^2.$$ (2.13)
The action (3.8) can be written as
\[ S_T = \int dt L_T, \] (2.14)
where the point-like Lagrangian reads
\[ L_T = a^3 (F - F_T T) - 6F_T a \ddot{a}^2 - a^3 L_m. \] (2.15)
The equations of F(T) gravity look like
\[ 12H^2 F_T + F = \rho, \] (2.16)
\[ 48H^2 F_T \dot{H} - F_T \left(12H^2 + 4\dot{H}\right) - F = p, \] (2.17)
\[ \dot{\rho} + 3H (\rho + p) = 0. \] (2.18)

2.3 \textit{F}(G) gravity

The action of \textit{F}(G) theory is given by
\[ S_G = \int d^4 x [F(G) + L_m], \] (2.19)
where the Gauss – Bonnet scalar \( G \) for the FRW metric is
\[ G = G_s = 24H^2 (\dot{H} + H^2). \] (2.20)

3 Geometrical roots of \textit{F}(R, T) gravity

We start from the M\textsubscript{43} - model (about our notations, see e.g.Refs. [10]-[11]). This model is one of the representatives of \textit{F}(R, T) gravity. The action of the M\textsubscript{43} - model reads as
\[ S_{43} = \int d^4 x \sqrt{-g} [F(R, T) + L_m], \] (3.1)
where \( L_m \) is the matter Lagrangian, \( \epsilon_i = \pm 1 \) (signature), \( R \) is the curvature scalar, \( T \) is the torsion scalar (about our notation see below). In this section we try to give one of the possible geometric formulations of M\textsubscript{43} - model. Note that we have different cases related with the signature: (1) \( \epsilon_1 = 1, \epsilon_2 = 1 \); (2) \( \epsilon_1 = 1, \epsilon_2 = -1 \); (3) \( \epsilon_1 = -1, \epsilon_2 = 1 \); (4) \( \epsilon_1 = -1, \epsilon_2 = -1 \). Also note that M\textsubscript{43} - model is a particular case of M\textsubscript{37} - model having the form
\[ S_{37} = \int d^4 x \sqrt{-g} [F(R, T) + L_m], \] (3.2)
where
\[ R_s = \epsilon_1 g^{\mu\nu} R_{\mu\nu}, \quad T_s = \epsilon_2 S_\rho^{\mu\nu} T_{\rho}^{\mu\nu}, \] (3.3)
are the standard forms of the curvature and torsion scalars.

3.1 General case

To understand the geometry of the M\textsubscript{43} - model, we consider some spacetime with the curvature and torsion so that its connection \( G^\lambda_{\mu\nu} \) is a sum of the curvature and torsion parts. In this paper, the Greek alphabets \((\mu, \nu, \rho, \ldots = 0, 1, 2, 3)\) are related to spacetime, and the Latin alphabets
(i, j, k,... = 0, 1, 2, 3) denote indices, which are raised and lowered with the Minkowski metric $\eta_{ij} = \text{diag} (-1,+1,+1,+1)$. For our spacetime the connection $G^\lambda_{\mu\nu}$ has the form

$$ G^\lambda_{\mu\nu} = e_i^\lambda \partial_\mu e^i_\nu + e_j^\lambda e^j_\nu \omega^j_{\mu\nu} = \Gamma^\lambda_{\mu\nu} + K^\lambda_{\mu\nu}. $$  

(3.4)

Here $\Gamma^j_{i\mu}$ is the Levi-Civita connection and $K^j_{i\mu}$ is the contorsion. Let the metric has the form

$$ ds^2 = g_{ij}dx^idx^j. $$  

(3.5)

Then the orthonormal tetrad components $e_i(x^\mu)$ are related to the metric through

$$ g_{\mu\nu} = \eta_{ij}e^i_\mu e^j_\nu, $$  

(3.6)

so that the orthonormal condition reads as

$$ \eta_{ij} = g_{\mu\nu}e^i_\mu e^j_\nu. $$  

(3.7)

Here $\eta_{ij} = \text{diag}(-1,1,1,1)$, where we used the relation

$$ e^i_\mu e^\mu_j = \delta^i_j. $$  

(3.8)

The quantities $\Gamma^j_{i\mu}$ and $K^j_{i\mu}$ are defined as

$$ \Gamma^j_{ijk} = \frac{1}{2}g^{tr} \left\{ \partial_k g_{rj} + \partial_j g_{rk} - \partial_r g_{jk} \right\}, $$  

(3.9)

and

$$ K^\lambda_{\mu\nu} = -\frac{1}{2} \left( T^\lambda_{\mu\nu} + T^\mu_{\lambda\nu} + T^\nu_{\lambda\mu} \right), $$  

(3.10)

respectively. Here the components of the torsion tensor are given by

$$ T^\lambda_{\mu\nu} = e_i^\lambda T^i_{\mu\nu} = G^\lambda_{\mu\nu} - G^\lambda_{\nu\mu}, $$  

(3.11)

$$ T^i_{\mu\nu} = \partial_\mu e^i_\nu - \partial_\nu e^i_\mu + G^j_{\mu\nu}e^j_\mu - G^j_{\mu\nu}e^j_\nu. $$  

(3.12)

The curvature $R^\rho_{\sigma\mu\nu}$ is defined as

$$ R^\rho_{\sigma\mu\nu} = e_i^\rho e^j_\sigma R^j_{\mu\nu} = \partial_\mu G^\rho_{\sigma\nu} - \partial_\nu G^\rho_{\sigma\mu} + G^\rho_{\lambda\mu}G^\lambda_{\sigma\nu} - G^\rho_{\lambda\nu}G^\lambda_{\sigma\mu} $$

$$ = \bar{R}^\rho_{\sigma\mu\nu} + \partial_\mu \bar{K}^\rho_{\sigma\nu} - \partial_\nu \bar{K}^\rho_{\sigma\mu} + \bar{K}^\rho_{\lambda\mu}K^\lambda_{\sigma\nu} - \bar{K}^\rho_{\lambda\nu}K^\lambda_{\sigma\mu} $$

$$ + \Gamma^\rho_{\mu\nu}K^\lambda_{\sigma\mu} - \Gamma^\rho_{\nu\mu}K^\lambda_{\sigma\nu} + \Gamma^\rho_{\nu\lambda}K^\lambda_{\sigma\mu} - \Gamma^\rho_{\mu\lambda}K^\lambda_{\sigma\nu}, $$  

(3.13)

where the Riemann curvature of the Levi-Civita connection is defined in the standard way

$$ \bar{R}^\rho_{\sigma\mu\nu} = \partial_\mu \Gamma^\rho_{\sigma\nu} - \partial_\nu \Gamma^\rho_{\sigma\mu} + \Gamma^\rho_{\nu\lambda}\Gamma^\lambda_{\sigma\mu} - \Gamma^\rho_{\mu\lambda}\Gamma^\lambda_{\sigma\nu}. $$  

(3.14)

Now we introduce two important quantities namely the curvature ($R$) and torsion ($T$) scalars as

$$ R = g^{ij}R_{ij}, $$  

(3.15)

$$ T = S^\rho_{\mu\nu}T^\rho_{\mu\nu}, $$  

(3.16)

where

$$ S^\rho_{\mu\nu} = \frac{1}{2} \left( K^\rho_{\mu\nu} + \delta^\rho_{\mu}T^\theta_{\nu} - \delta^\rho_{\nu}T^\theta_{\mu} \right). $$  

(3.17)

Then the M43 - model we write in the form (3.1). To conclude this subsection, we note that in GR, it is postulated that $T^\lambda_{\mu\nu} \equiv 0$ and such 4-dimensional spacetime manifolds with metric and without torsion are labelled as $V_4$. At the same time, it is a general convention to call $U_4$, the manifolds endowed with metric and torsion. 

3.2 FRW case

From here we work with the spatially flat FRW metric

\[ ds^2 = -dt^2 + a^2(t)(dx^2 + dy^2 + dz^2), \]  

(3.18)

where \( a(t) \) is the scale factor. In this case, the non-vanishing components of the Levi-Civita connection are

\[ \Gamma^0_{00} = \Gamma^0_{01} = \Gamma^0_{10} = \Gamma^i_{00} = \Gamma^i_{jk} = 0, \]

\[ \Gamma^0_{0j} = a^2 \dot{H} \delta_{ij}, \]

\[ \Gamma^0_{jo} = \Gamma^i_{oj} = H \delta^i_j, \]

(3.19)

where \( H = (\ln a)_t \) and \( i, j, k, \ldots = 1, 2, 3 \). Now let us calculate the components of torsion tensor. Its non-vanishing components are given by:

\[ T_{110} = T_{220} = T_{330} = a^2 h, \]

\[ T_{121} = T_{231} = T_{312} = 2a^3 f, \]

(3.20)

where \( h \) and \( f \) are some real functions (see e.g. Refs. [12]). Note that the indices of the torsion tensor are raised and lowered with respect to the metric, that is

\[ T_{ijk} = g_{kl}T^l_{ij}. \]

(3.21)

Now we can find the contortion components. We get

\[ K_{10}^{10} = K_{20}^{30} = K_{30}^{30} = 0, \]

\[ K_{10}^{01} = K_{20}^{02} = K_{30}^{03} = h, \]

\[ K_{01}^{01} = K_{02}^{22} = K_{03}^{23} = a^2 h, \]

\[ K_{12}^{23} = K_{23}^{31} = K_{31}^{12} = -af, \]

(3.22)

\[ K_{13}^{13} = K_{21}^{21} = K_{32}^{32} = af. \]

The non-vanishing components of the curvature \( R_{\rho\sigma\mu\nu} \) are given by

\[ R^0_{101} = R^0_{202} = R^0_{303} = a^2 (H + H^2 + H h + \dot{h}), \]

\[ R^0_{123} = -R^0_{213} = R^0_{312} = 2a^3 f (H + h), \]

\[ R^1_{203} = -R^1_{302} = R^1_{320} = -a(H f + \dot{f}), \]

\[ R^1_{212} = R^1_{313} = R^2_{323} = a^2 [(H + h)^2 - f^2]. \]

(3.23)

Similarly, we write the non-vanishing components of the Ricci curvature tensor \( R_{\mu\nu} \) as

\[ R_{00} = -3\dot{H} - 3\dot{h} - 3H^2 - 3H h, \]

\[ R_{11} = R_{22} = R_{33} = a^2 (\dot{H} + \dot{h} + 3H^2 + 5H h + 2h^2 - f^2). \]

(3.24)

At the same time, the non-vanishing components of the tensor \( S_{\rho\mu}^{\nu\nu} \) are given by

\[ S_1^{10} = \frac{1}{2} (K_1^{10} + \delta_1^0 T^{00}_\theta - \delta_1^0 T^{0\theta}_0) = \frac{1}{2} (h + 2h) = h, \]

(3.25)

\[ S_1^{10} = S_2^{20} = S_3^{30} = 2h, \]

(3.26)

\[ S_1^{23} = \frac{1}{2} (K_1^{23} + \delta_1^3 + \delta_1^2) = -\frac{f}{2a}, \]

(3.27)

\[ S_1^{23} = S_2^{31} = S_3^{21} = -\frac{f}{2a}, \]

(3.28)

and

\[ T = T_{101}^{10} + T_{202}^{20} + T_{303}^{30} + T_{123}^{23} + T_{231}^{31} + T_{312}^{12}. \]

(3.29)
Now we are ready to write the explicit forms of the curvature and torsion scalars. We have

\[
R = 6(\dot{H} + 2H^2) + 6\dot{h} + 18HHh + 6h^2 - 3f^2 \quad (3.30)
\]

\[
T = 6(h^2 - f^2). \quad (3.31)
\]

So finally for the FRW metric, the $M_{43}$ - model takes the form

\[
S_{43} = \int d^4x \sqrt{-g}[F(R,T) + L_m],
\]

\[
R = 6(\dot{H} + 2H^2) + 6\dot{h} + 18HHh + 6h^2 - 3f^2, \quad (3.32)
\]

\[
T = 6(h^2 - f^2).
\]

It (that is the $M_{43}$ - model) is one of geometrical realizations of $F(R,T)$ gravity in the sense that it was derived from the purely geometrical point of view.

4 Lagrangian formulation of $F(R, T)$ gravity

Of course, we can work with the form (3.32) of $F(R, T)$ gravity. But a more interesting and general form of $F(R, T)$ gravity is the so-called $M_{37}$ - model. The action of the $M_{37}$ - gravity reads as [10]

\[
S_{37} = \int d^4x \sqrt{-g}[F(R,T) + L_m],
\]

\[
R = u + R_s = u + 6\epsilon_1(\dot{H} + 2H^2),
\]

\[
T = v + T_s = v + 6\epsilon_2H^2, \quad (4.1)
\]

where

\[
R_s = 6\epsilon_1(\dot{H} + 2H^2), \quad T_s = 6\epsilon_2H^2. \quad (4.2)
\]

So we can see that here instead of two functions $h$ and $f$ in (3.32), we introduced two new functions $u$ and $v$. For example, for (3.32) these functions have the form

\[
u = 6(1 - \epsilon_1)(\dot{H} + 2H^2) + 6\dot{h} + 18HHh + 6h^2 - 3f^2, \quad (4.3)
\]

\[
v = 6(h^2 - f^2 - \epsilon_2H^2) \quad (4.4)
\]

that again tells us that the $M_{43}$ - model is a particular case of $M_{37}$ - model [Note that if $\epsilon_1 = 1 = \epsilon_2$ we have $u = 6\dot{h} + 18HHh + 6h^2 - 3f^2$, $v = 6(h^2 - f^2 - H^2)].$ But in general we think (or assume) that $u = u(t, a, \dot{a}, \ddot{a}, ...; f_i)$ and $v = v(t, a, \dot{a}, \ddot{a}, ...; g_i)$, while $f_i$ and $g_i$ are some unknown functions related with the geometry of the spacetime. So below we will work with a more general form of $F(R,T)$ gravity namely the $M_{37}$ - gravity (4.1). Introducing the Lagrangian multipliers we now can rewrite the action (4.1) as

\[
S_{37} = \int dt a^3 \left\{ F(R,T) - \lambda \left[ T - v - 6\epsilon_2 \frac{\dot{a}^2}{a^2} \right] - \gamma \left[ R - u - 6\epsilon_1 \left( \frac{\ddot{a}}{a} + \frac{\dot{a}^2}{a^2} \right) \right] + L_m \right\}, \quad (4.5)
\]

where $\lambda$ and $\gamma$ are Lagrange multipliers. If we take the variations with respect to $T$ and $R$ of this action, we get

\[
\lambda = F_T, \quad \gamma = F_R. \quad (4.6)
\]

Therefore, the action (4.5) can be rewritten as

\[
S_{37} = \int dt a^3 \left\{ F(R,T) - F_T \left[ T - v - 6\epsilon_2 \frac{\dot{a}^2}{a^2} \right] - F_R \left[ R - u - 6\epsilon_1 \left( \frac{\ddot{a}}{a} + \frac{\dot{a}^2}{a^2} \right) \right] + L_m \right\}. \quad (4.7)
\]

Then the corresponding point-like Lagrangian reads

\[
L_{37} = a^3[F - (T - v)F_T - (R - u)F_R + L_m] - 6(\epsilon_1F_R - \epsilon_2F_T)a\dot{a}^2 - 6\epsilon_1(F_{RR}\ddot{R} + F_{RT}\dot{R})a^2\ddot{a}. \quad (4.8)
\]
As is well known, for our dynamical system, the Euler-Lagrange equations read as

\begin{align}
\frac{d}{dt}\left(\frac{\partial L_{37}}{\partial \dot{a}}\right) - \frac{\partial L_{37}}{\partial a} &= 0, \\
\frac{d}{d\tau}\left(\frac{\partial L_{37}}{\partial \dot{R}}\right) - \frac{\partial L_{37}}{\partial R} &= 0, \\
\frac{d}{d\tau}\left(\frac{\partial L_{37}}{\partial \dot{T}}\right) - \frac{\partial L_{37}}{\partial T} &= 0.
\end{align}

Hence, using the expressions

\begin{align}
\frac{\partial L_{37}}{\partial R} &= -6\epsilon_1 F_{RR} a^2 \ddot{a}, \\
\frac{\partial L_{37}}{\partial T} &= -6\epsilon_1 F_{RT} a^2 \ddot{a}, \\
\frac{\partial L_{37}}{\partial a} &= -12(\epsilon_1 F_R - \epsilon_2 F_T) a \ddot{a} - 6\epsilon_1 (F_{RR} \ddot{R} + F_{RT} \ddot{T} + F_{R\psi} \ddot{\psi}) a^2 + a^3 F_T v_a + a^3 F_R u_a,
\end{align}

we get

\begin{align}
a^3 F_{TT} \left(T - v - 6\epsilon_2 \frac{\ddot{a}^2}{a^2}\right) &= 0, \\
a^3 F_{RR} \left(R - u - 6\epsilon_1 \left(\frac{\ddot{a}}{a} + \frac{\ddot{a}^2}{a^2}\right)\right) &= 0,
\end{align}

\begin{align}
U + B_2 F_{TT} + B_1 F_T + C_2 F_{RRT} + C_1 F_{RTT} + C_0 F_{RT} + MF + 6\epsilon_2 a^2 p &= 0,
\end{align}

respectively. Here

\begin{align}
U &= A_3 F_{RRR} + A_2 F_{RR} + A_1 F_R, \\
A_3 &= -6\epsilon_1 \ddot{R}^2 a^2, \\
A_2 &= -12\epsilon_1 \ddot{R} a a - 6\epsilon_1 \ddot{R} a^2 + a^3 \ddot{R} u_a, \\
A_1 &= 12\epsilon_1 \ddot{a}^2 + 6\epsilon_1 a \ddot{a} + 3a^2 \ddot{a} u_a + a^3 \ddot{u}_a - a^3 u_a, \\
B_2 &= 12\epsilon_2 \ddot{a} T a \ddot{a} + a^3 \ddot{T} v_a, \\
B_1 &= 24\epsilon_2 \ddot{a}^2 + 12\epsilon_2 a \ddot{a} + 3a^2 \ddot{a} v_a + a^3 \ddot{v}_a - a^3 v_a, \\
C_2 &= -12\epsilon_1 a^2 \ddot{T}, \\
C_1 &= -6\epsilon_1 a^2 \ddot{T}^2, \\
C_0 &= -12\epsilon_1 \ddot{T} a \ddot{a} + 12\epsilon_2 \ddot{R} a - 6\epsilon_1 a^2 \ddot{a} + a^3 \ddot{R} v_a + a^3 \ddot{T} u_a, \\
M &= -3a^2.
\end{align}

If \( F_{RR} \neq 0 \), \( F_{TT} \neq 0 \), from Eqs. (4.17) and (4.17), it is easy to find that

\begin{align}
R = u + 6\epsilon_1 (\ddot{H} + 2\dot{H}^2), \\
T = v + 6\epsilon_2 H^2,
\end{align}

so that the relations (4.1) are recovered. Generally, these equations are the Euler constraints of the dynamics. Here \( a, R, T \) are the generalized coordinates of the configuration space. On the other hand, it is also well known that the total energy (Hamiltonian) corresponding to Lagrangian \( L_{37} \) is given by

\begin{equation}
H_{37} = \frac{\partial L_{37}}{\partial \dot{a}} \ddot{a} + \frac{\partial L_{37}}{\partial \dot{R}} \ddot{R} + \frac{\partial L_{37}}{\partial \dot{T}} \ddot{T} - L_{37}.
\end{equation}

Hence using (4.12)-(4.14) we obtain

\begin{align}
H_{37} &= [-12(\epsilon_1 F_R - \epsilon_2 F_T) a \ddot{a} - 6\epsilon_1 (F_{RR} \ddot{R} + F_{RT} \ddot{T} + F_{R\psi} \ddot{\psi}) a^2 + a^3 F_T v_a + a^3 F_R u_a] \dot{a} \\
&- 6\epsilon_1 F_{RR} a^2 \ddot{R} - 6\epsilon_1 F_{RT} a^2 \ddot{T} - [a^3 (F - TF_T - RF_R + vF_T + uF_R + L_m) -] \\
&6(\epsilon_1 F_R - \epsilon_2 F_T) a \ddot{a}^2 - 6\epsilon_1 (F_{RR} \ddot{R} + F_{RT} \ddot{T} + F_{R\psi} \ddot{\psi}) a^2 \ddot{a}].
\end{align}
Let us rewrite this formula as

\[ H_{37} = D_2 F_{RR} + D_1 F_R + J F_{RT} + E_1 F_T + K F + 2a^3 \rho, \]  

(4.31)

where

\[
\begin{align*}
D_2 &= -6\epsilon_1 \tilde{R} a^2 \dot{a}, \\
D_1 &= 6\epsilon_1 \tilde{a}^2 + a^3 u_2 \dot{a}, \\
J &= -6\epsilon_1 a^2 \tilde{a} \ddot{T}, \\
E_1 &= 12\epsilon_2 \tilde{a}^2 + a^3 v_2 \dot{a}, \\
K &= -a^3.
\end{align*}
\]

(4.32)

(4.33)

(4.34)

(4.35)

(4.36)

As usual we assume that the total energy \( H_{37} = 0 \) (Hamiltonian constraint). So finally we have the following equations of the M_{37} - model [10]-[11]:

\[
\begin{align*}
D_2 F_{RR} + D_1 F_R + J F_{RT} + E_1 F_T + K F &= -2a^3 \rho, \\
U + B_2 F_{TT} + B_1 F_T + C_2 F_{RRT} + C_1 F_{RTT} + C_0 F_{RT} + M F &= 6a^2 \rho, \\
\dot{\rho} + 3H(\rho + p) &= 0.
\end{align*}
\]

(4.37)

It deserves to note that the M_{37} - model (4.1) admits some interesting particular and physically important cases. Some particular cases are now presented.

i) The M_{44} - model. Let the function \( F(R,T) \) be independent from the torsion scalar \( T \): \( F = F(R,T) = F(R) \). Then the action (4.1) acquires the form

\[ S_{44} = \int d^4 x e [F(R) + L_m], \]

(4.38)

where

\[ R = u + R_\varepsilon = u + \epsilon_1 g^{\mu\nu} R_{\mu\nu}, \]

(4.39)

is the curvature scalar. It is the M_{44} - model. We work with the FRW metric. In this case \( R \) takes the form

\[ R = u + 6\epsilon_1 (\dot{H} + 2H^2). \]

(4.40)

The action can be rewritten as

\[ S_{44} = \int dt L_{44}, \]

(4.41)

where the Lagrangian is given by

\[ L_{44} = a^3 [F - (R - u) F_R + L_m] - 6\epsilon_1 F_{Ra} \tilde{a}^2 - 6\epsilon_1 F_{RR} \tilde{R} a^2 \dot{a}. \]

(4.42)

The corresponding field equations of the M_{44} - model read as

\[
\begin{align*}
D_2 F_{RR} + D_1 F_R + K F &= -2a^3 \rho, \\
A_3 F_{RRR} + A_2 F_{RR} + A_1 F_R + M F &= 6a^2 \rho, \\
\dot{\rho} + 3H(\rho + p) &= 0.
\end{align*}
\]

(4.43)

Here

\[
\begin{align*}
D_2 &= -6\epsilon_1 \tilde{R} a^2 \dot{a}, \\
D_1 &= 6\epsilon_1 a^2 \tilde{a} + a^3 u_2 \dot{a}, \\
K &= -a^3.
\end{align*}
\]

(4.44)

(4.45)

(4.46)

and

\[
\begin{align*}
A_3 &= -6\epsilon_1 \tilde{R}^2 a^2, \\
A_2 &= -12\epsilon_1 \tilde{R} a \ddot{a} - 6\epsilon_1 \tilde{R} a^2 + a^3 \tilde{R} u_2, \\
A_1 &= 12\epsilon_2 \tilde{a}^2 + 6\epsilon_1 \tilde{a}^2 + 3a^2 \tilde{a} u_2 + a^3 \tilde{a} - a^3 u_2, \\
M &= -3a^2.
\end{align*}
\]

(4.47)

(4.48)

(4.49)

(4.50)
If \( u = 0 \) then we get the following equations of the standard \( F(R_s) \) gravity (after \( R = R_s \)):

\[
6RHF - (R - 6H^2)F + F = \rho, \quad (4.51)
\]

\[
-2\tilde{R}^2F_{RR} + [\tilde{R}F_{RR} + [\tilde{R}^2 - 2\tilde{R}F_{RR} + [-2H^2 - 4a^{-1}\tilde{u} + \tilde{R}]F - F = \rho, \quad (4.52)
\]

\[
\dot{\rho} + 3H(\rho + p) = 0. \quad (4.53)
\]

**ii) The \( M_{45} \) - model.** The action of the \( M_{45} \) - model looks like

\[
S_{45} = \int d^4x e[F(T) + L_m], \quad (4.54)
\]

where \( e = \det (e^i_j) = \sqrt{-g} \) and the torsion scalar \( T \) is defined as

\[
T = v + T_s = v + 2S_{\rho}^{\mu\nu}T_{\rho}^{\mu\nu}. \quad (4.55)
\]

Here

\[
T_{\rho}^{\mu\nu} \equiv -e^i_i (\partial_i e^i_{\nu} - \partial_{\nu} e^i_i),
\]

\[
K_{\mu\rho}^{\nu} \equiv -\frac{1}{2} (T_{\rho}^{\mu\nu} - T_{\nu}^{\mu\rho} - T_{\rho}^{\mu\nu}),
\]

\[
S_{\rho}^{\mu\nu} \equiv \frac{1}{2} (K_{\mu\rho}^{\nu} + \delta_{\rho}^{\nu}T_{\rho}^{\theta\mu} - \delta_{\rho}^{\mu}T_{\rho}^{\theta\nu}). \quad (4.58)
\]

For a spatially flat FRW metric (3.18), we have the torsion scalar in the form

\[
T = v + T_s = v + 6\epsilon_s H^2. \quad (4.59)
\]

The action (4.54) can be written as

\[
S_{45} = \int dt L_{45}, \quad (4.60)
\]

where the point-like Lagrangian reads

\[
L_{45} = a^3[F - (T - v)F_T + L_m] + 6\epsilon_s F_T a\tilde{u}^2. \quad (4.61)
\]

So finally we get the following equations of the \( M_{45} \) - model:

\[
E_1F_T + KF = -2a^3\rho, \quad (4.62)
\]

\[
B_2F_{TT} + B_1F_T + MF = 6a^3p, \quad (4.62)
\]

\[
\dot{\rho} + 3H(\rho + p) = 0. \quad (4.62)
\]

Here

\[
E_1 = 12\epsilon_s a\tilde{u}^2 + a^3v_3\tilde{u}, \quad (4.63)
\]

\[
K = -a^3 \quad (4.64)
\]

and

\[
B_2 = 12\epsilon_s \tilde{T}a\tilde{u} + a^3\tilde{T}v_3, \quad (4.65)
\]

\[
B_1 = 24\epsilon_s a^2 + 12\epsilon_s a\tilde{u} + 3a^3\tilde{v}_3 + a^3v_3 - a^3v_3, \quad (4.66)
\]

\[
M = -3a^3. \quad (4.67)
\]

If we put \( v = 0 \) then the \( M_{45} \) - model reduces to the usual \( F(T_s) \) gravity, where \( T_s = 6\epsilon_s H^2 \). As is well-known the equations of \( F(T_s) \) gravity are given by

\[
12H^2F_T + F = \rho, \quad (4.68)
\]

\[
48H^2F_{TT}H - F_T (12H^2 + 4H) - F = \rho, \quad (4.69)
\]

\[
\dot{\rho} + 3H(\rho + p) = 0. \quad (4.70)
\]

where we must put \( T = T_s \). Finally we note that it is well-known that the standard \( F(T_s) \) gravity is not local Lorentz invariant [33]. In this context, we have a very meager hope that the \( M_{45} \) - model (4.54) is free from such problems.
5 Cosmological solutions

In this section we investigate cosmological consequences of the $F(R,T)$ gravity. As example, we want to find some exact cosmological solutions of the $M_{37}$-gravity model. Since its equations are very complicated we here consider the simplest case when

$$F(R,T) = \mu R + \nu T,$$

where $\mu$ and $\nu$ are some constants. Then equations (4.37) take the form

$$\mu D_1 + \nu E_1 + K(\nu T + \mu R) = -2a^3 \rho,$$

$$\mu A_1 + \nu B_1 + M(\nu T + \mu R) = 6a^2 p,$$

where

$$D_1 = 6\epsilon_1 a^2 \dot{a} + a^3 u \dot{a},$$

$$E_1 = 12\epsilon_2 a^2 \dot{a} + a^3 v \dot{a},$$

$$K = -a^3,$$

$$A_1 = 12\epsilon_1 a^2 + 6\epsilon_1 a \ddot{a} + 3a^2 \dot{a} u \ddot{a} + a^3 u \ddot{a} - a^3 u,$$

$$B_1 = 24\epsilon_2 a^2 + 12\epsilon_2 a \ddot{a} + 3a^2 \dot{a} v \ddot{a} + a^3 v \ddot{a} - a^3 v,$$

$$M = -3a^2. (5.8)$$

We can rewrite this system as

$$3\sigma H^2 - 0.5(\dot{a} z - z) = \rho,$$

$$-\sigma(2\dot{H} + 3H^2) + 0.5(\dot{a} z - z) + \frac{1}{6} a(\ddot{a} z - z) = p,$$

$$\dot{\rho} + 3H(\rho + p) = 0.$$

(5.9)

At the same time the EoS parameter becomes

$$\omega = \frac{p}{\rho} = -1 - \frac{2\sigma \dot{H} + \frac{1}{6} a(\ddot{a} z - z)}{3\sigma H^2 - 0.5(\dot{a} z - z)}. (5.10)$$

Let us find some simplest cosmological solutions of the system (5.9).

5.1 Example 1

We start from the case $\sigma = 0$. In this case the system (5.9) takes the form

$$-0.5(\dot{a} z - z) = \rho,$$

$$0.5(\dot{a} z - z) + \frac{1}{6} a(\ddot{a} z - z) = p,$$

$$\dot{\rho} + 3H(\rho + p) = 0.$$

(5.11)

At the same time the EoS parameter becomes

$$\omega = \frac{p}{\rho} = -1 - \frac{a(\ddot{a} z - z)}{3(\dot{a} z - z)}. (5.12)$$

Now we assume that

$$z = \kappa a^l,$$

where $\kappa$ and $l$ are some real constants. Then

$$\omega = -1 - \frac{l}{3}.$$

(5.13)

This result tells us that in this case our model can describes the accelerated expansion of the Universe for some values of $l$. 

11
5.2 Example 2

Now consider the de Sitter case that is \( H = H_0 = \text{const} \) so that \( a = a_0 e^{H_0 t} \). Then the system (5.9) reads as

\[
\begin{align*}
3\sigma H_0^2 - 0.5(\dot{a}z_a - z) &= \rho, \\
-3\sigma H_0^2 + 0.5(\dot{a}z_a - z) + \frac{1}{6}a(\dot{z}_a - z_a) &= p, \\
\dot{\rho} + 3H(\rho + p) &= 0.
\end{align*}
\]

(5.15)

The EoS parameter takes the form

\[
\omega = \frac{p}{\rho} = -1 + \frac{a(\dot{z}_a - z_a)}{18\sigma H_0^2 - 3(\dot{a}z_a - z)}.
\]

(5.16)

If \( z \) has the form (5.13) that is \( z = \kappa e^{H_0 t} \) then we have

\[
\omega = \frac{p}{\rho} = -1 - \frac{\kappa}{18\sigma H_0^2 e^{-H_0 t} + 3\kappa}.
\]

(5.17)

If \( H_0 l > 0 \) then as \( t \to \infty \) we get again

\[
\omega = -1 - \frac{l}{3},
\]

(5.18)

which is same as equation (5.14). This last equation tells us that our model can describes the accelerated expansion of the Universe e.g. for \( l \geq 0 \). Also it corresponds to the phantom case if \( l > 0 \). Finally we present other forms of the generalized Friedmann equations in the system (5.9). Let us rewrite these equations in the standard form as

\[
\begin{align*}
3H^2 &= \rho + \rho_z, \\
-(2\dot{H} + 3H^2) &= p + p_z.
\end{align*}
\]

(5.19) (5.20)

Here

\[
\begin{align*}
\rho_z &= 0.5\sigma^{-1}(\dot{a}z_a - z), \\
p_z &= -0.5\sigma^{-1}(\dot{a}z_a - z) - \frac{1}{6\sigma}a(\dot{z}_a - z_a)
\end{align*}
\]

(5.21) (5.22)

are the \( z \) or \( u - v \) contributions to the energy density and pressure, respectively.

6 Conclusion

In [30], Buchdahl proposed to replace the Einstein-Hilbert scalar Lagrangian \( R \) with a function of the scalar curvature. The resulting theory is nowadays known as \( F(R) \) gravity. Almost 40 years later, Bengochea and Ferraro proposed to replace the TEGR that is the torsion scalar Lagrangian \( T \) with a function \( F(T) \) of the torsion scalar, and studied its cosmological consequences [31]. This type of modified gravity is nowadays called as \( F(T) \) gravity theory. These two gravity theories [that is \( F(R) \) and \( F(T) \)] are, in some sense, alternative ways to modify GR. From these results arises the natural question: how we can construct some modified gravity theory which unifies \( F(R) \) and \( F(T) \) theories? Examples of such unified curvature-torsion theories were proposed in [10]-[11]. Such type of modified gravity theory is called the \( F(R,T) \) gravity. In this \( F(R,T) \) gravity, the curvature scalar \( R \) and the torsion scalar \( T \) play the same role and are dynamical quantities. In this paper, we have shown that the \( F(R,T) \) gravity can be derived from the geometrical point of view. In particular, we have proposed a new method to construct particular models of \( F(R,T) \) gravity. As an example we have considered the \( M_{43} \) model, deriving its action in terms of the curvature and torsion scalars. Then in detail we have studied the \( M_{37} \) model and presented its action, Lagrangian and equations of motion for the FRW metric case. Finally we have shown that the last model can describes the accelerated expansion of the Universe.
Concluding, we would like to note that in the paper, we present a special class of extended gravity models depending on arbitrary function $F(R,T)$, where $R$ is the Ricci scalar and $T$ the scalar torsion. While in the traditional Einstein-Cartan theory, the role of the torsion depends on the non trivial source associated with spin matter density, in our $F(R,T)$ gravity models, the torsion can propagate without the presence of spin matter density. In fact this is a crucial point, otherwise the additional scalar torsion degree of freedom are not different from the additional metric gravitational degree of freedom present in extended $F(R)$ models. Finally we would like to note that all results of this paper are new and different than results of our previous papers [10]-[11] on the subject.
