5:00 pm, KMI Science Symposia (ES-635)

“Current status of top quark condensation”

Hidenori S Fukano

KMI, Nagoya University

Abstract:

In this talk, I will talk about a model based on top quark condensation in light of current LHC data. The top quark condensation predicts a composite Higgs boson, so-called top-Higgs boson, in general. I will introduce the top quark condensation and then discuss phenomenological status of the top-Higgs boson.
