Signatures of the Conformal Window

Elisabetta Pallante
University of Groningen

Work done in collaboration with:
A. Deuzeman, M.P. Lombardo, K. Miura, T. Nunes da Silva (lattice)
A. Barranco, J. Russo (AdS/CFT)

2008 Nf=8 is in the QCD phase

2009 Nf=12 is in the conformal window
(there is a conformal window)

Deuzeman, Lombardo EP 2008 2009

Outline

Aims and strategy

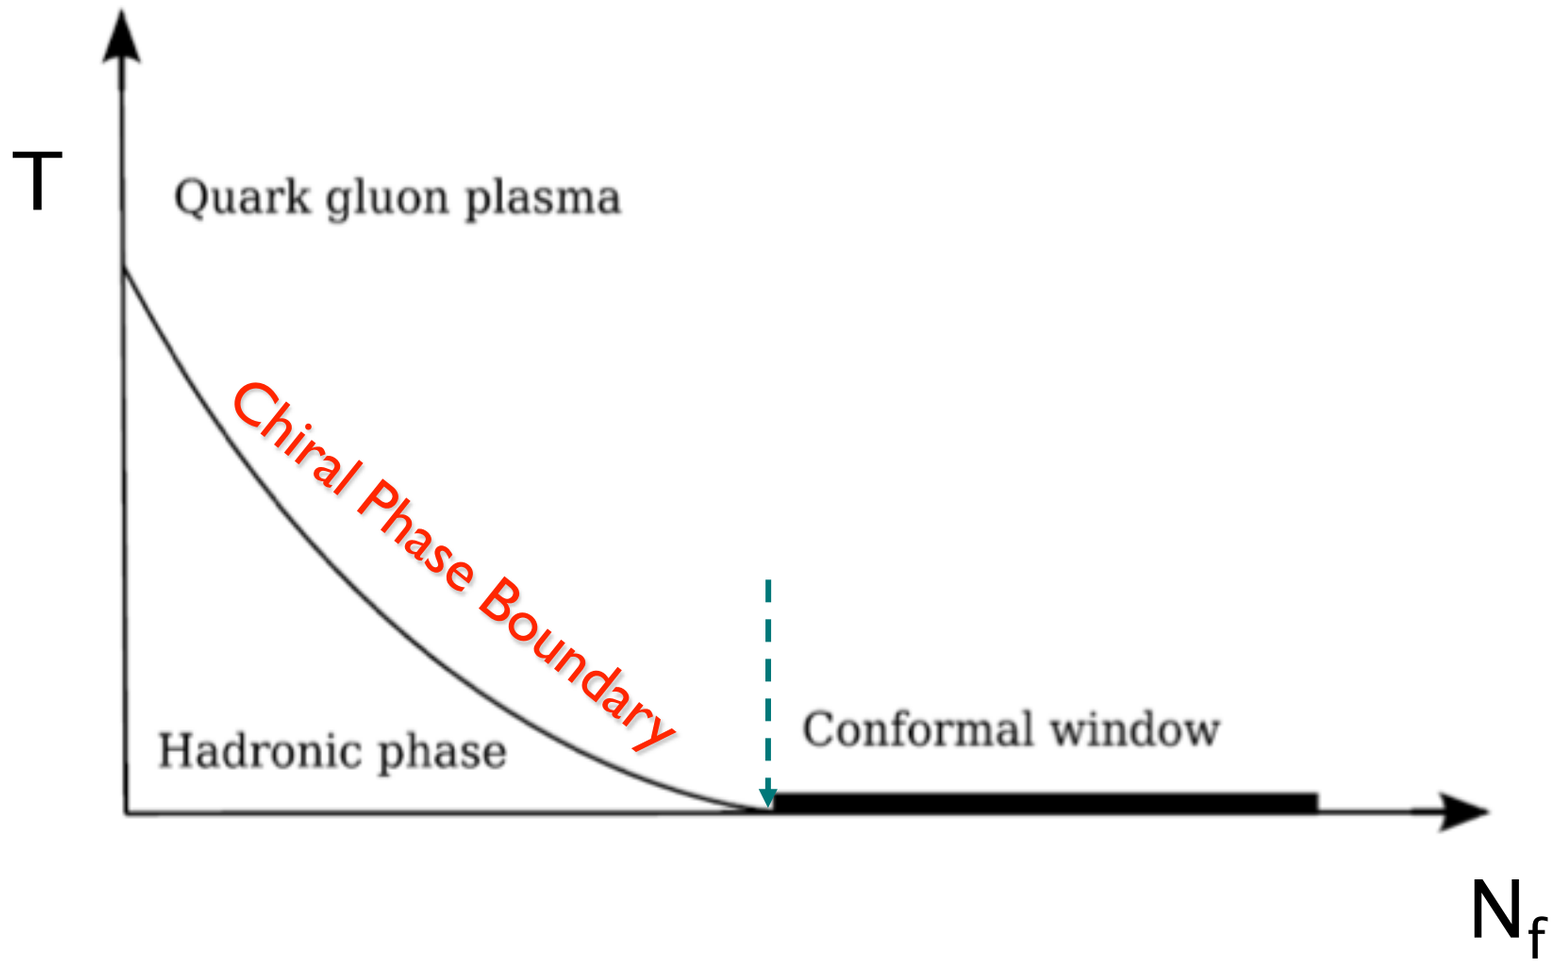
The spectrum

The strong coupling side: Bulk transitions

The fate of U(1) axial

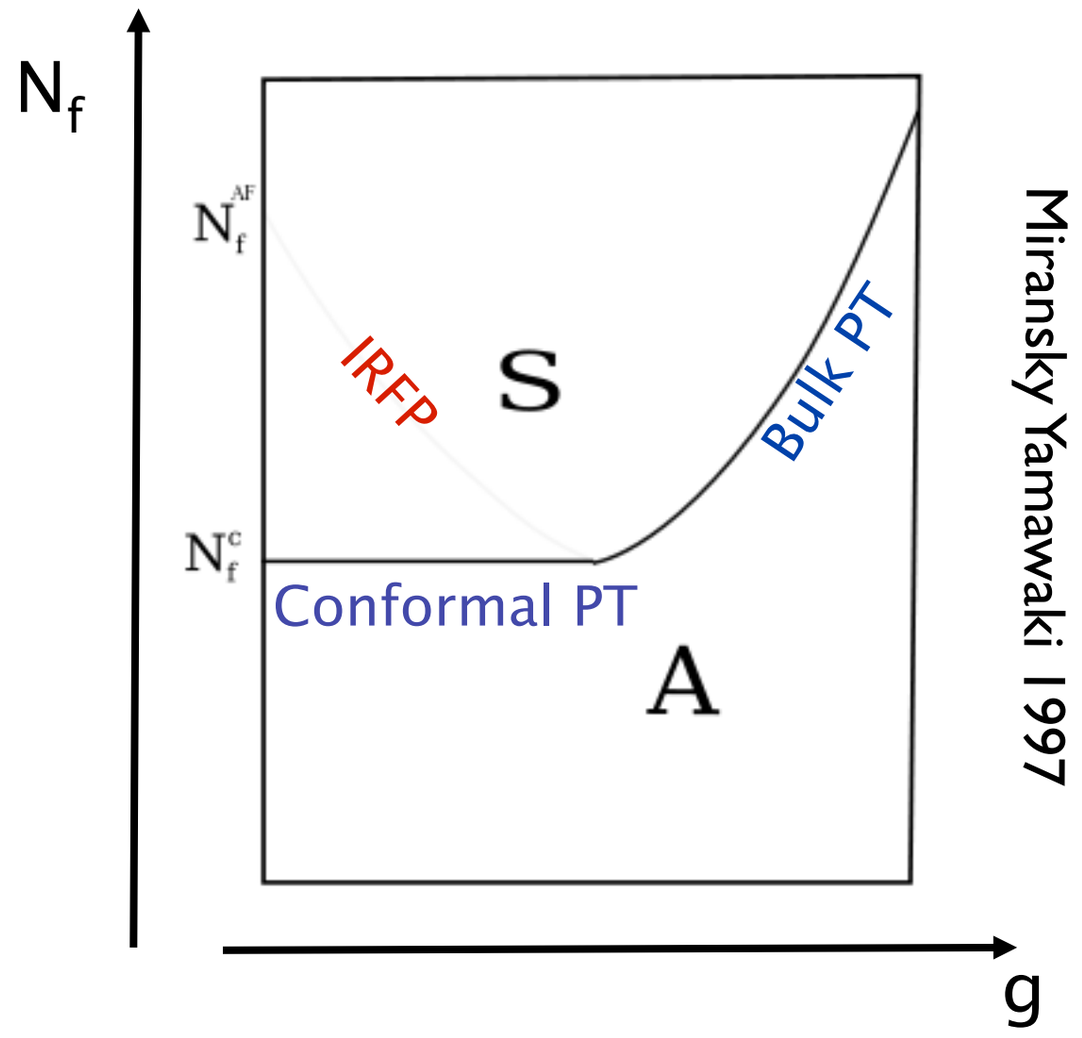
Disappearance of conformality with AdS/CFT

Aims and Strategy I: Temperature - Flavor



Talk by K. Miura

Aims and Strategy II: Flavor - Coupling (T=0)



I	II	III
Exact chiral	Exact chiral	Broken chiral
β<0	β>0	UVFP?

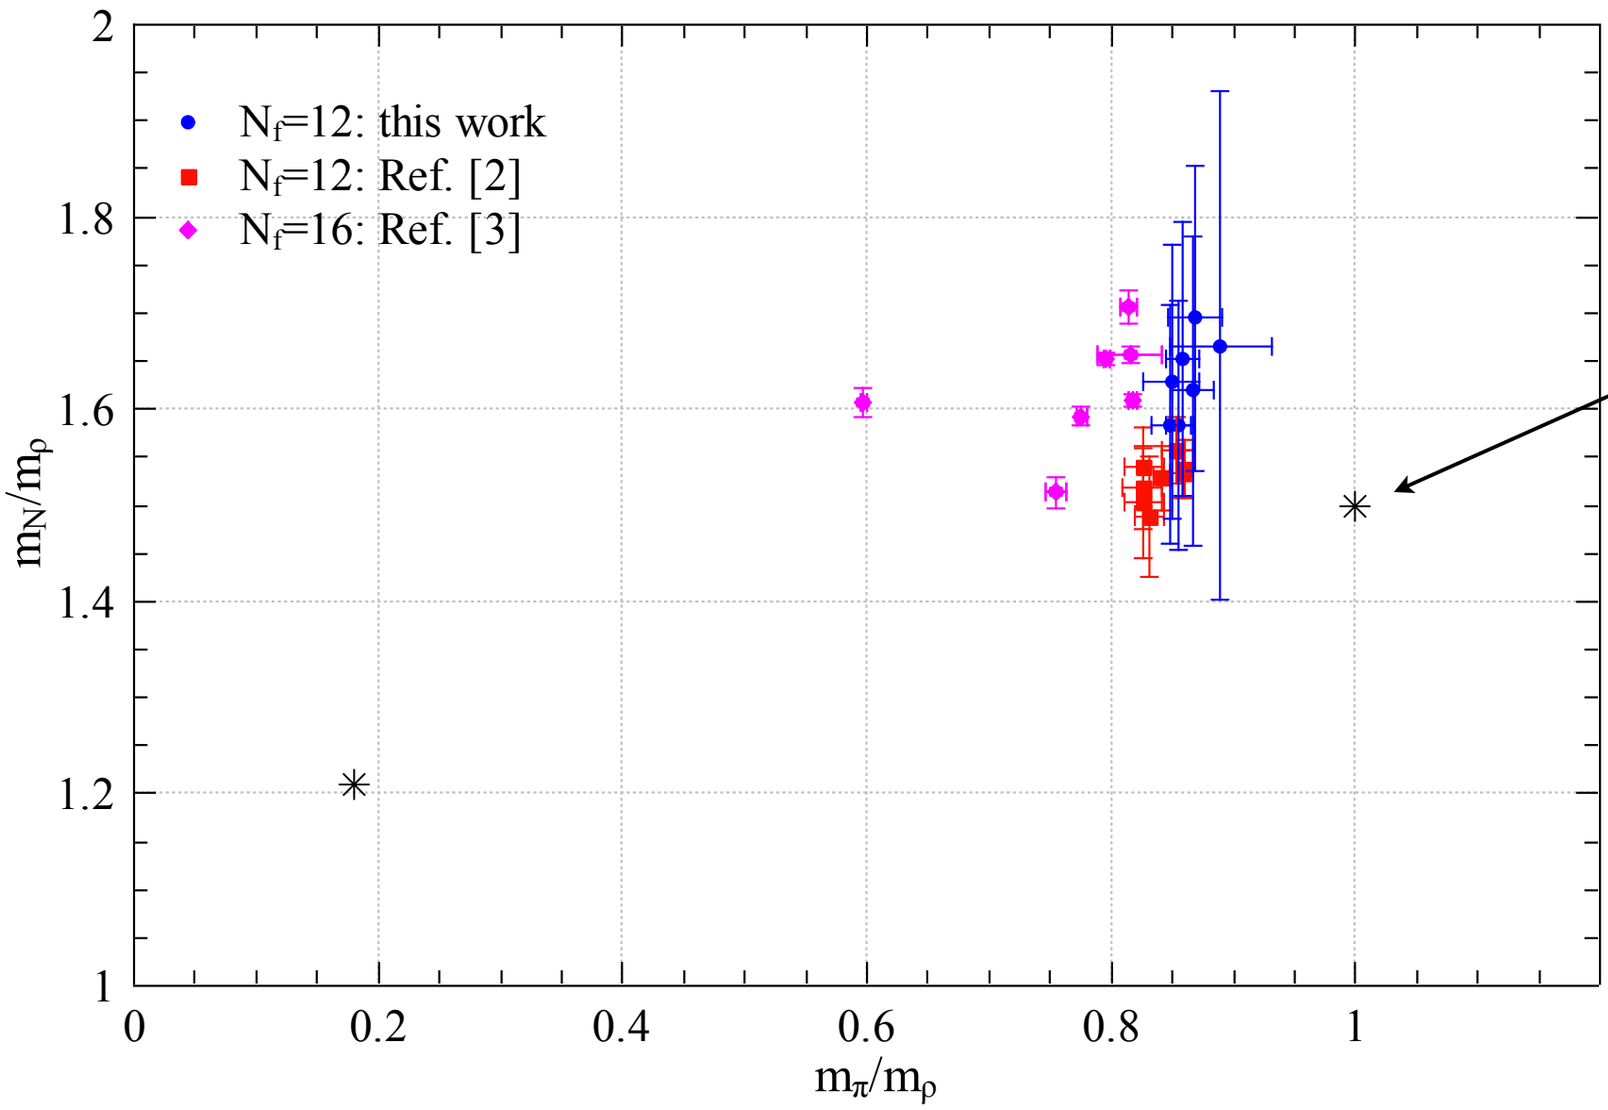
The spectrum

QCD and non-QCD

$\frac{m_\pi}{m_\rho} \sim \sqrt{m}$	$\frac{m_\pi}{m_\rho} \sim$ const
For fixed lattice spacing:	
$(\frac{am_\pi}{am})^2 \sim$ const	$\frac{(am_\pi)^2}{am} \sim \frac{(am)^{2\delta \to 2}}{am} \sim (am)^{2\delta-1}$ $\quad 0.5<\delta\lesssim 1$

Corrections to power laws are present for an interacting theory not at FP
(and finite volume)

The Edinburgh Plot of Nf=12 and Nf=16



Heavy quark limit or free theory

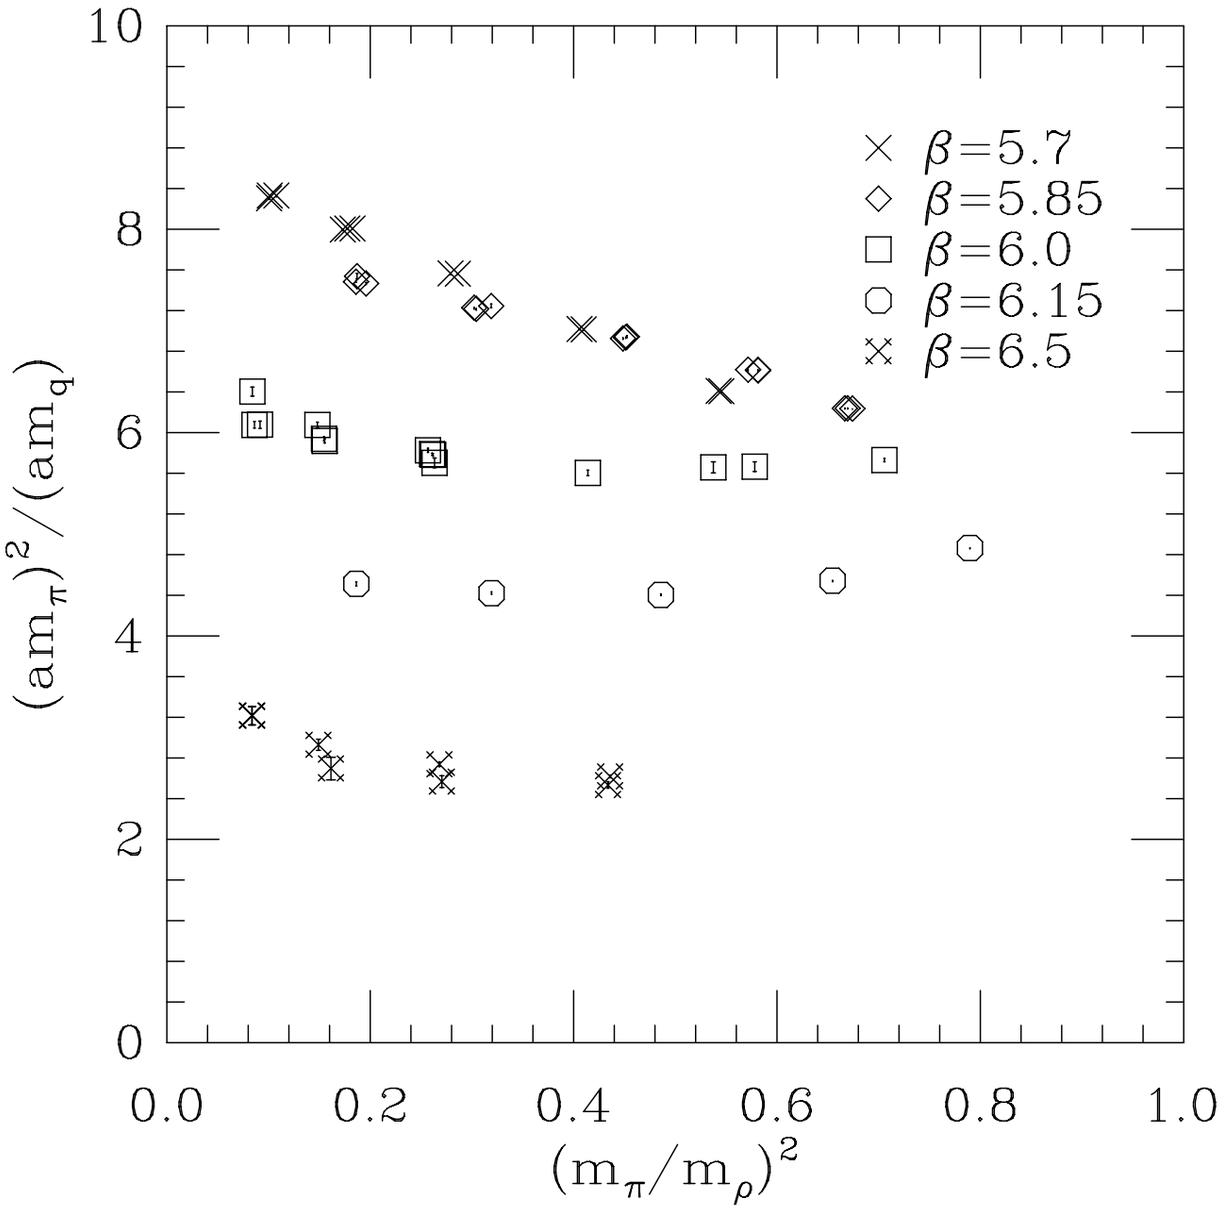
Bare quark masses span a range 0.01 to 0.07 at various β for Nf=12

Bare quark masses span a range 0.025 to 0.15 at various β for Nf=16

Damgaard, Heller, Krasnitz, Olesen 1997

Fodor, Holland, Kuti, Nogradi, Schroeder 2011

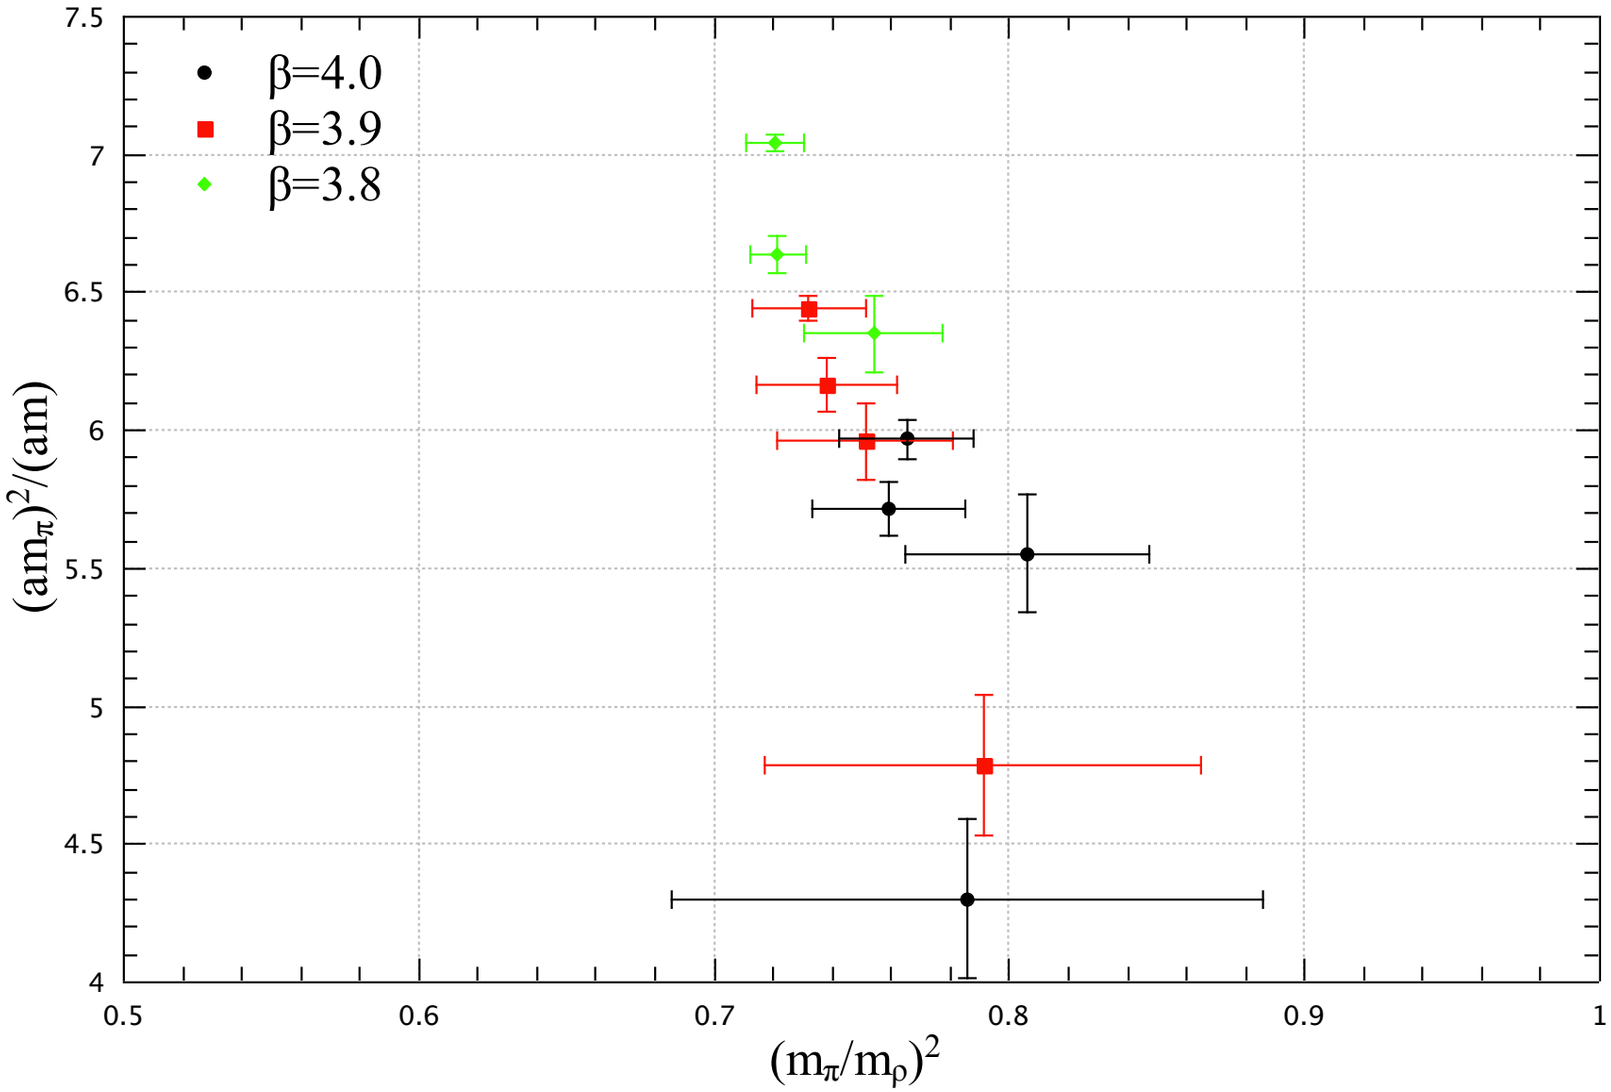
QCD



↑ Ratio increases

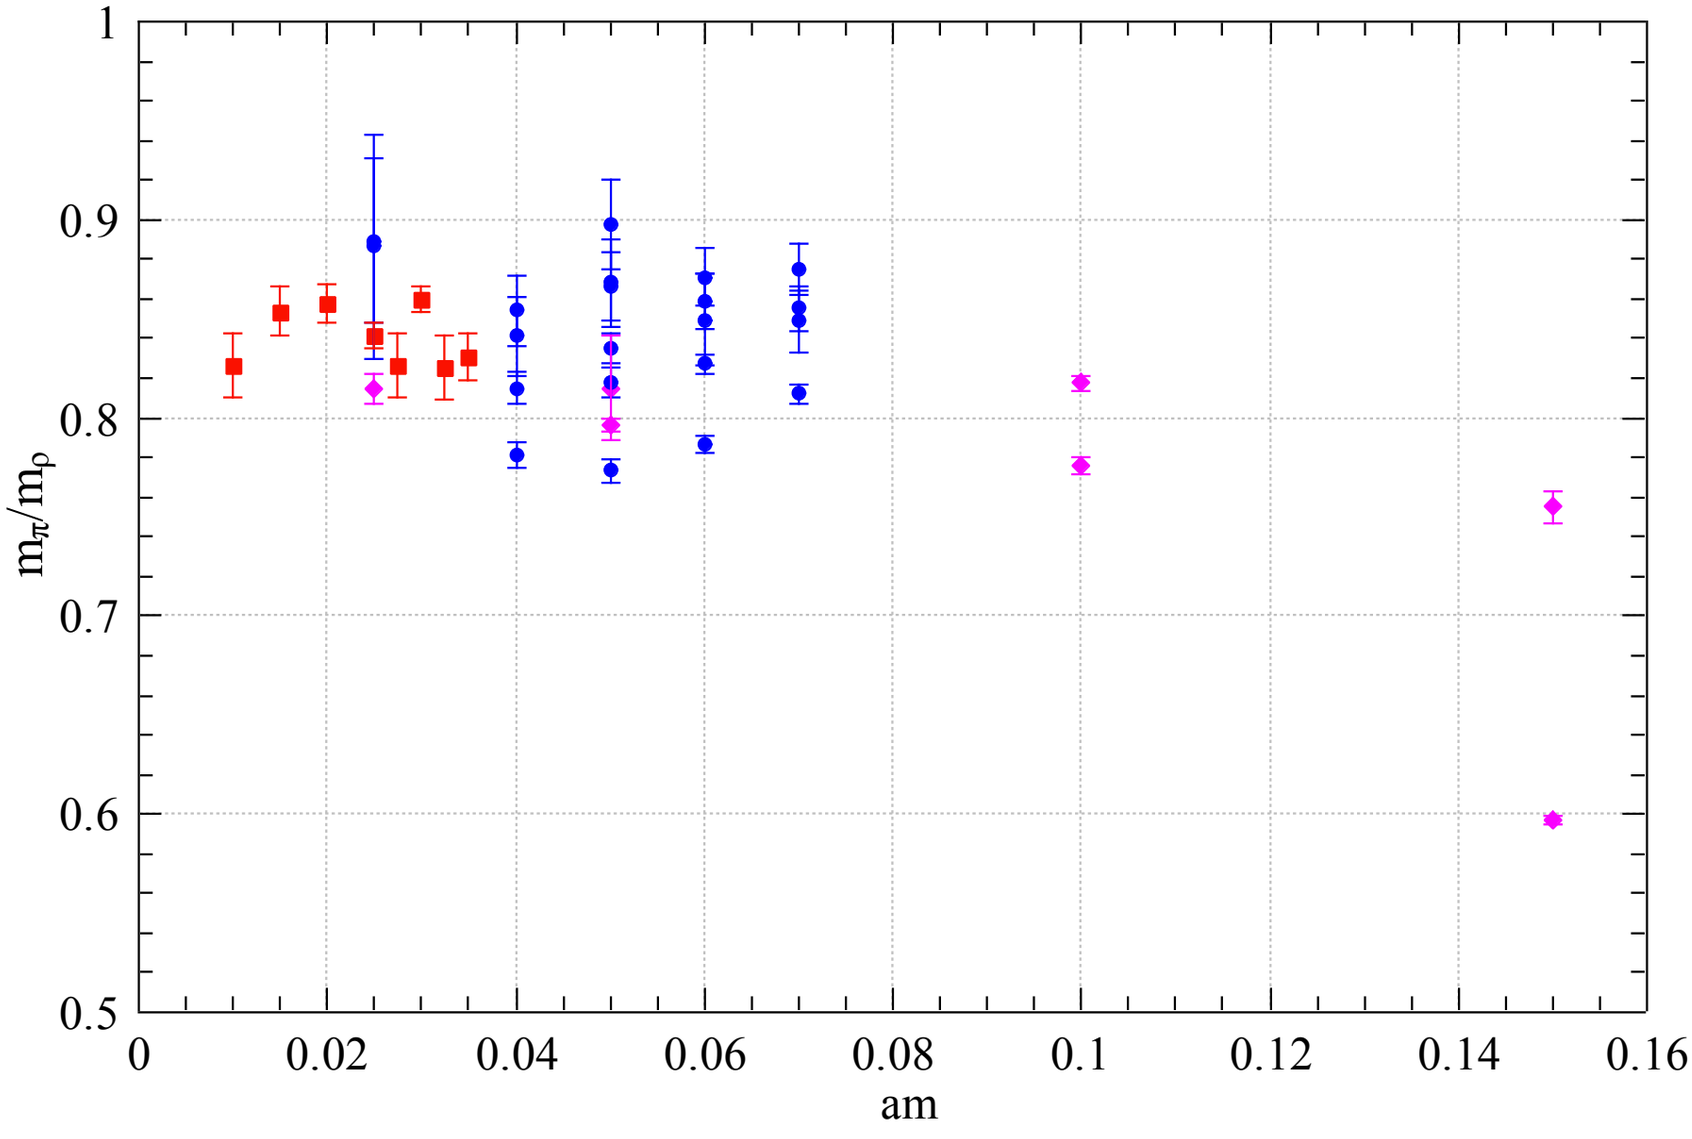
This is compatible with a negative β function

and non-QCD



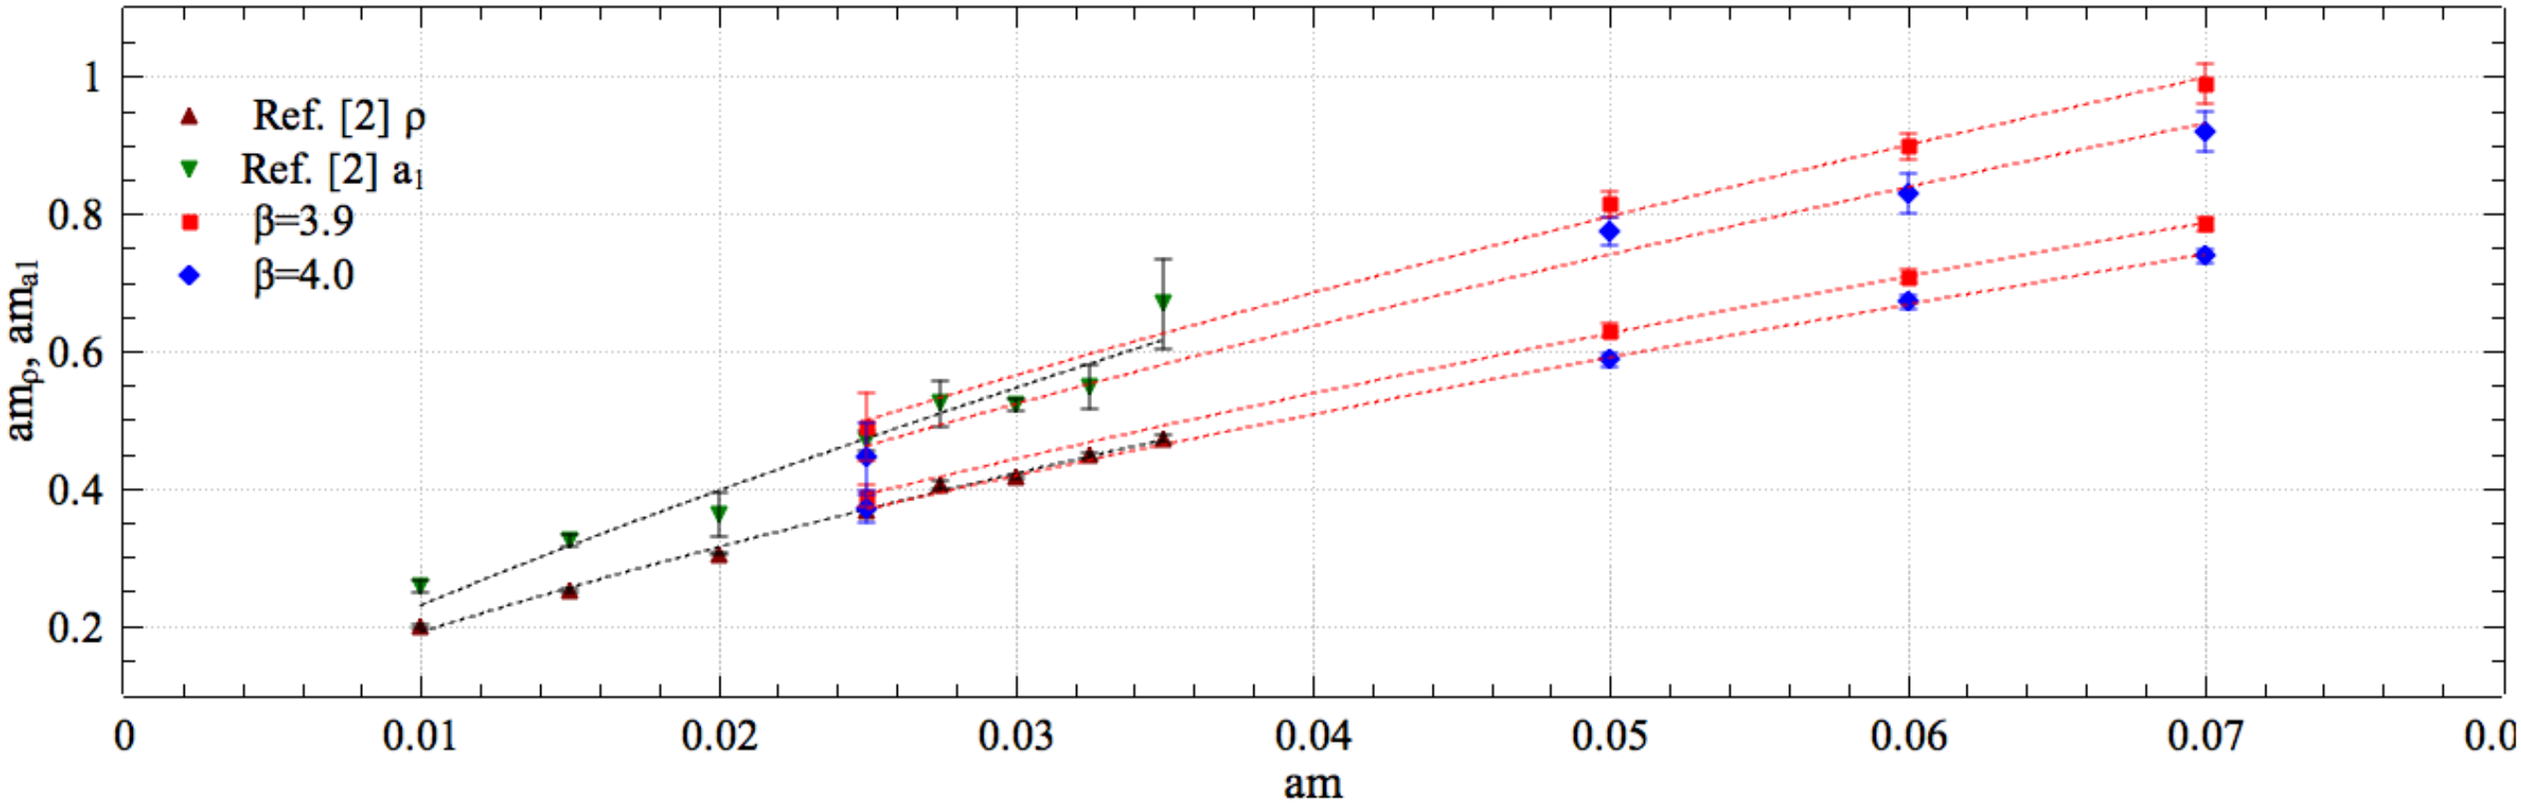
For a fixed m_π/m_ρ the inverted behavior with β_L is compatible with a positive β function

Masses and Power Laws



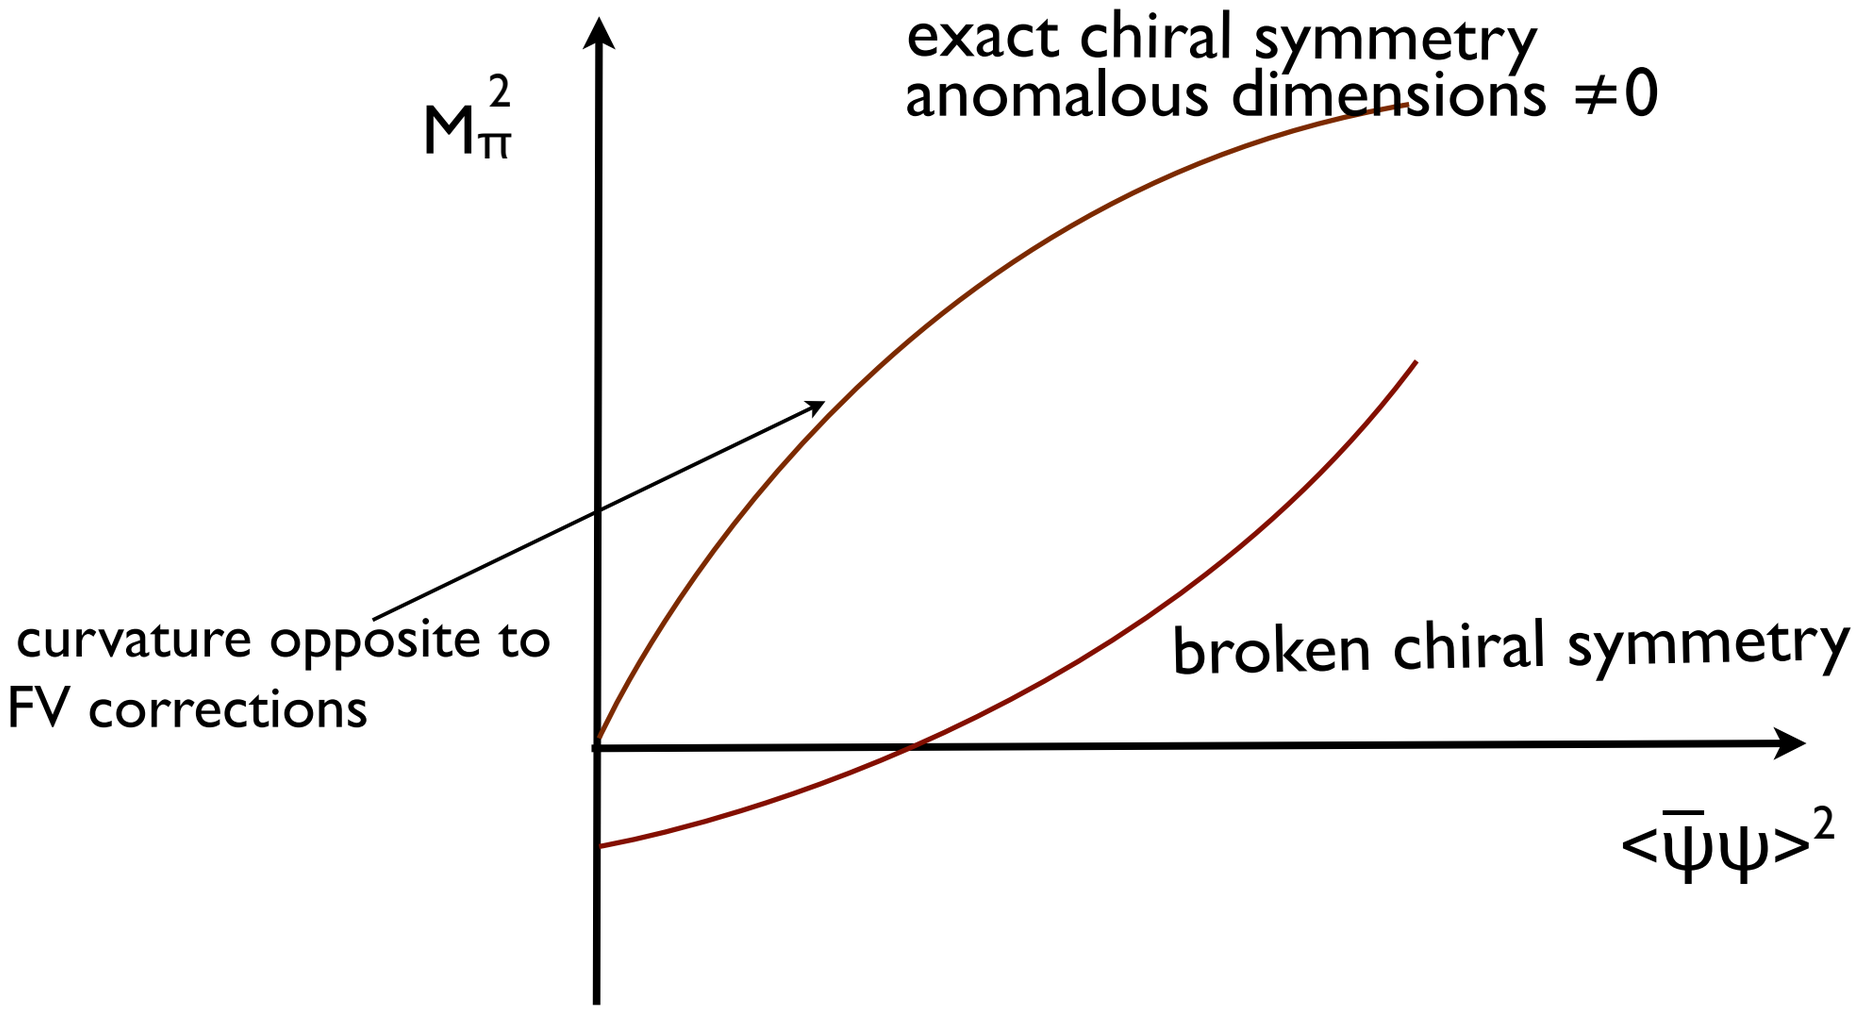
The ratio is approximately constant in a chirally symmetric phase.
It goes to zero in the chiral (massless) limit of QCD.

The axial-vector mass splitting



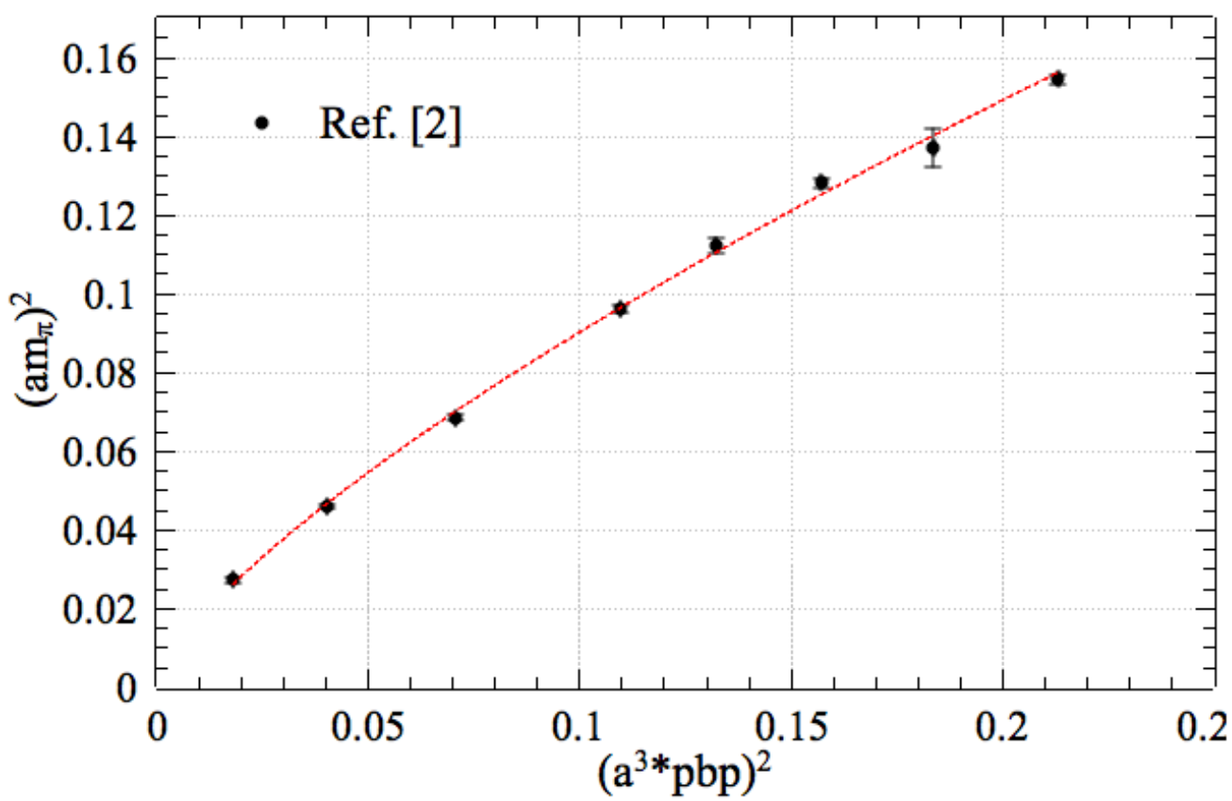
Degeneracy in the chiral (massless) limit signals that chiral symmetry is restored.

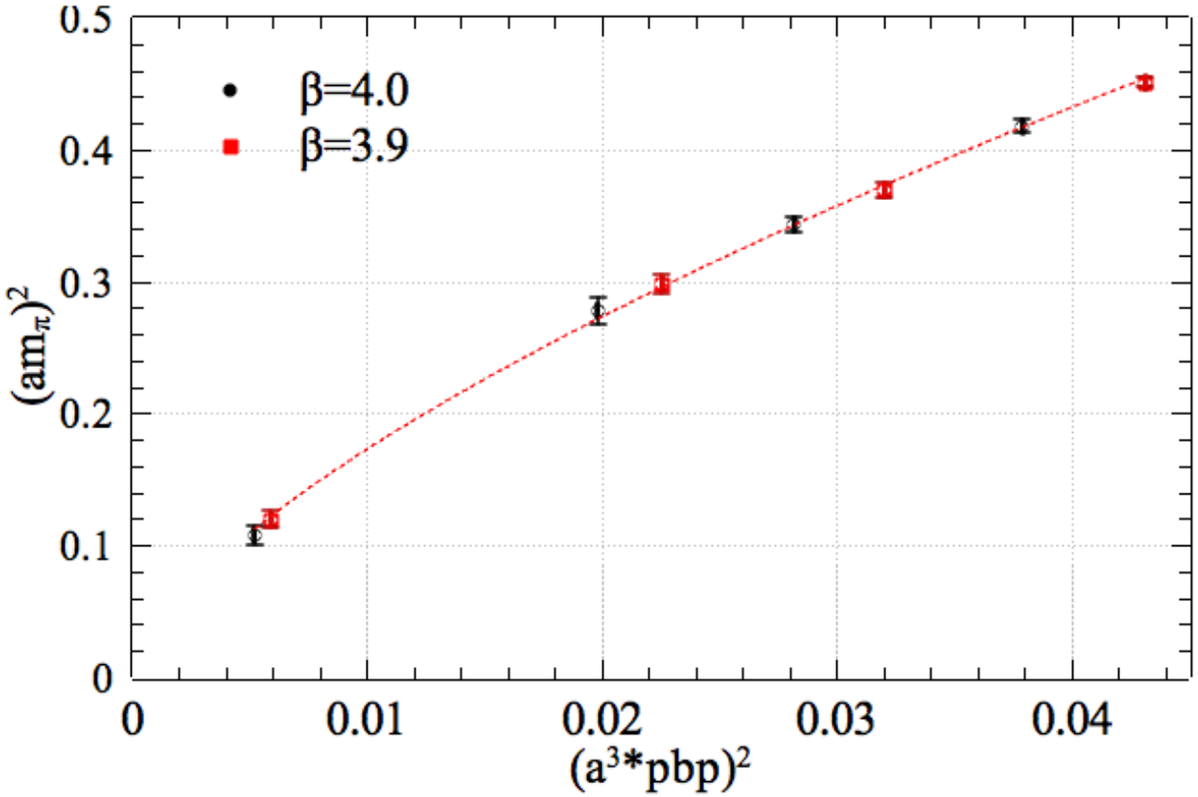
Pseudo Goldstone mass and chiral condensate



Kocic Kogut Lombardo 1993

Nf=12: lattice data





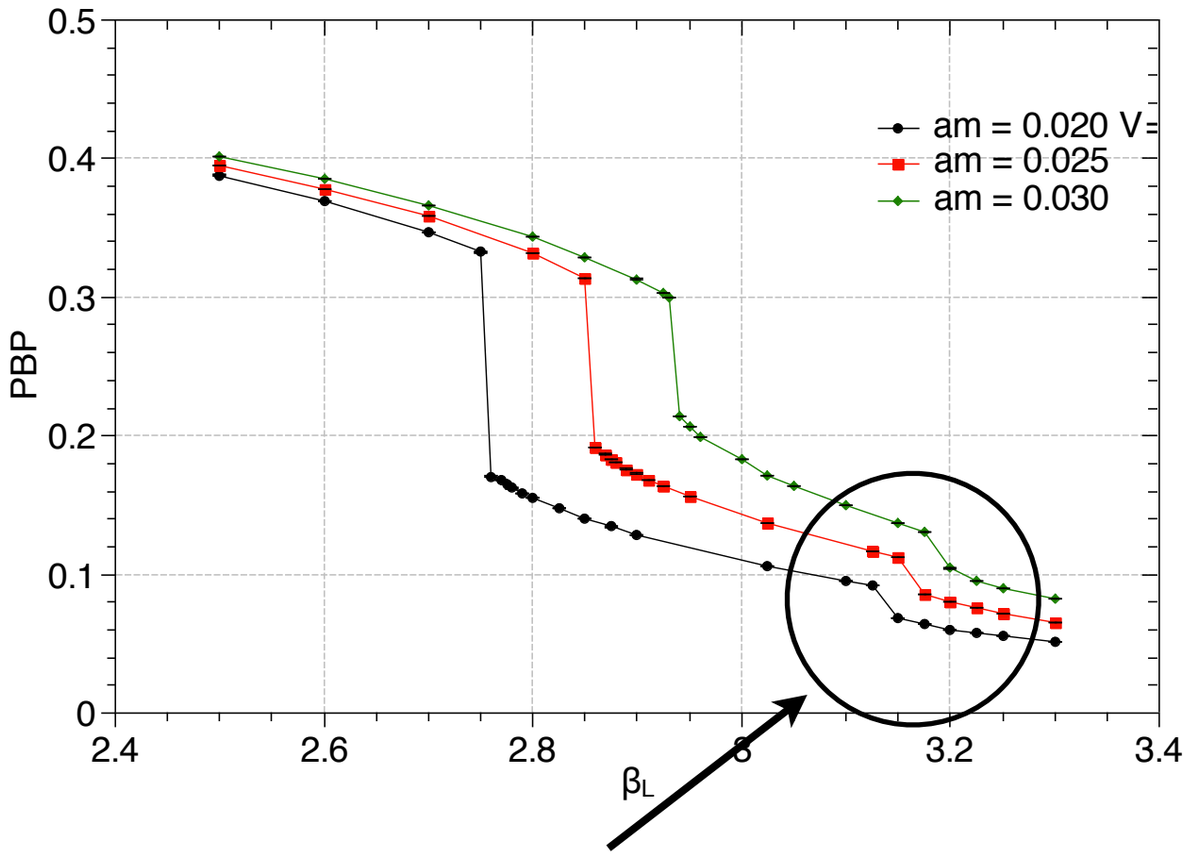
Exact chiral symmetry with non zero anomalous dimensions

Bulk transitions

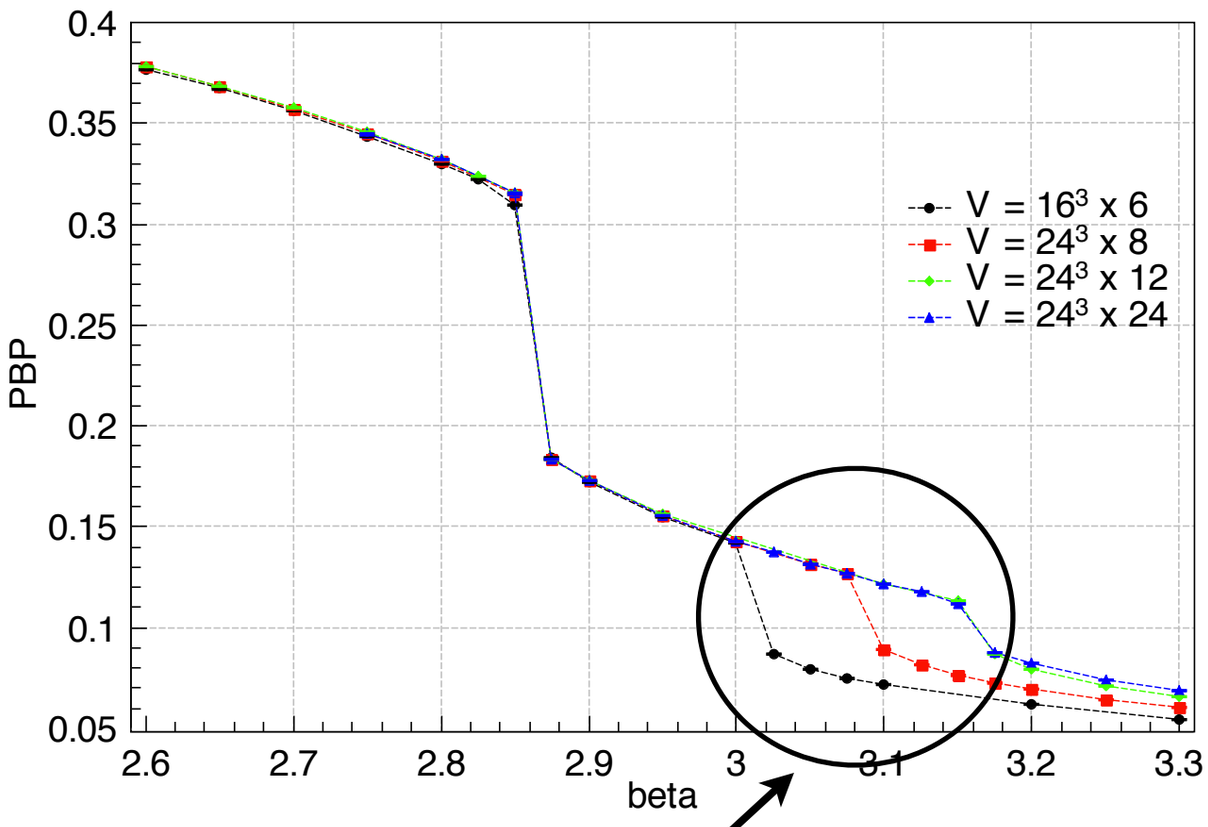
Having already established that there is a bulk transition to a chirally broken phase...
Is it signalling the emergence of a UVFP? Or something else does happen.

The chiral condensate

Lattice fermion action: Naik improved staggered
Lattice gauge action: tree level Symanzik improved
Volumes: 16cx6, 24, 24cx8, 12, 24 (6cx6, 12cx24)
Lattice masses: 0.03, 0.025, 0.02, (0.015)



does not increase
with m decreasing



N_t dependence only for $N_t \leq 12$

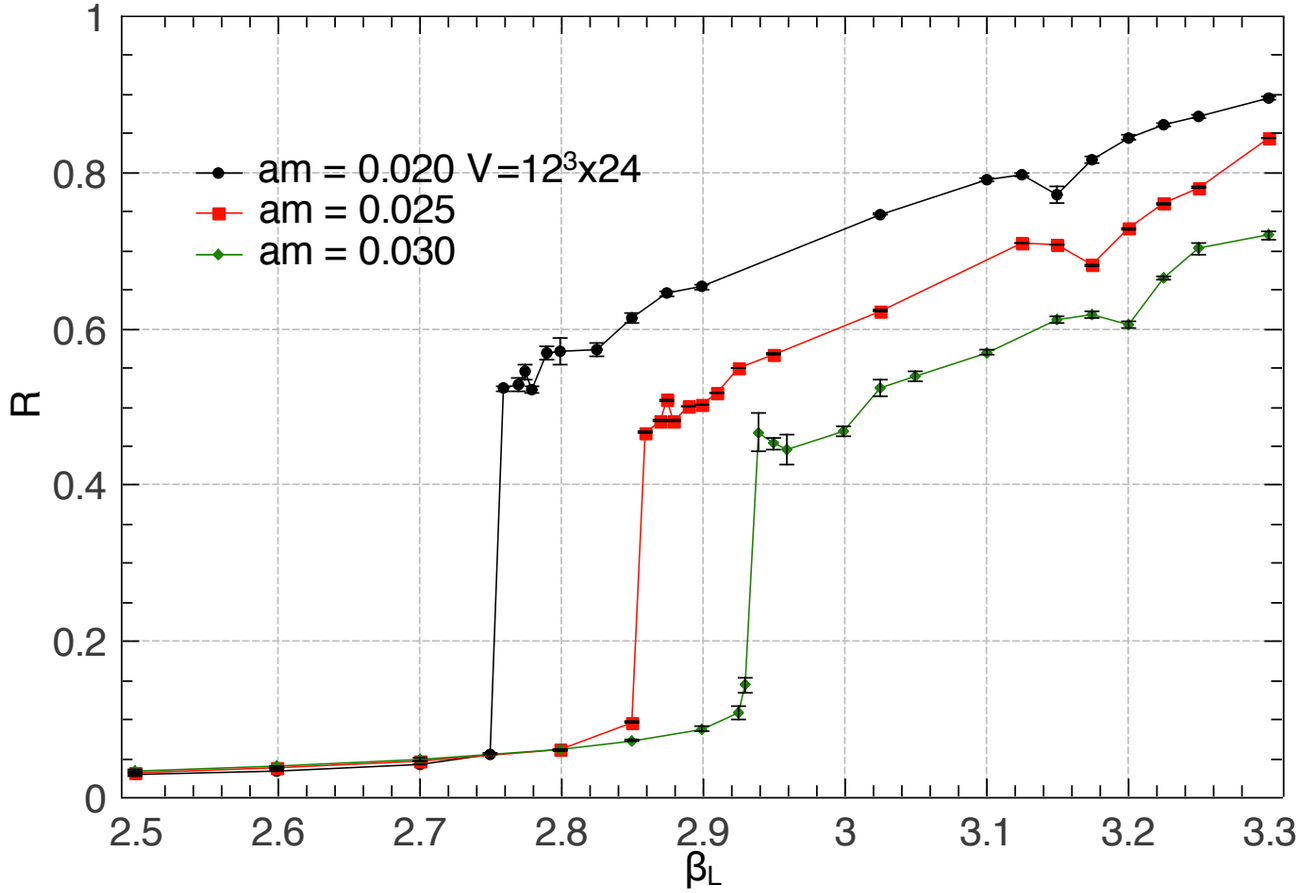
The chiral cumulant

$R = \chi_\pi^{-1}/\chi_\sigma^{-1}$

$\chi_\sigma = \chi_{conn} + \chi_{disc}$

$\chi_\pi = \langle\overline{\psi}\psi\rangle/m$

$M_p^2 = Z_p\, \chi_p^{-1}$



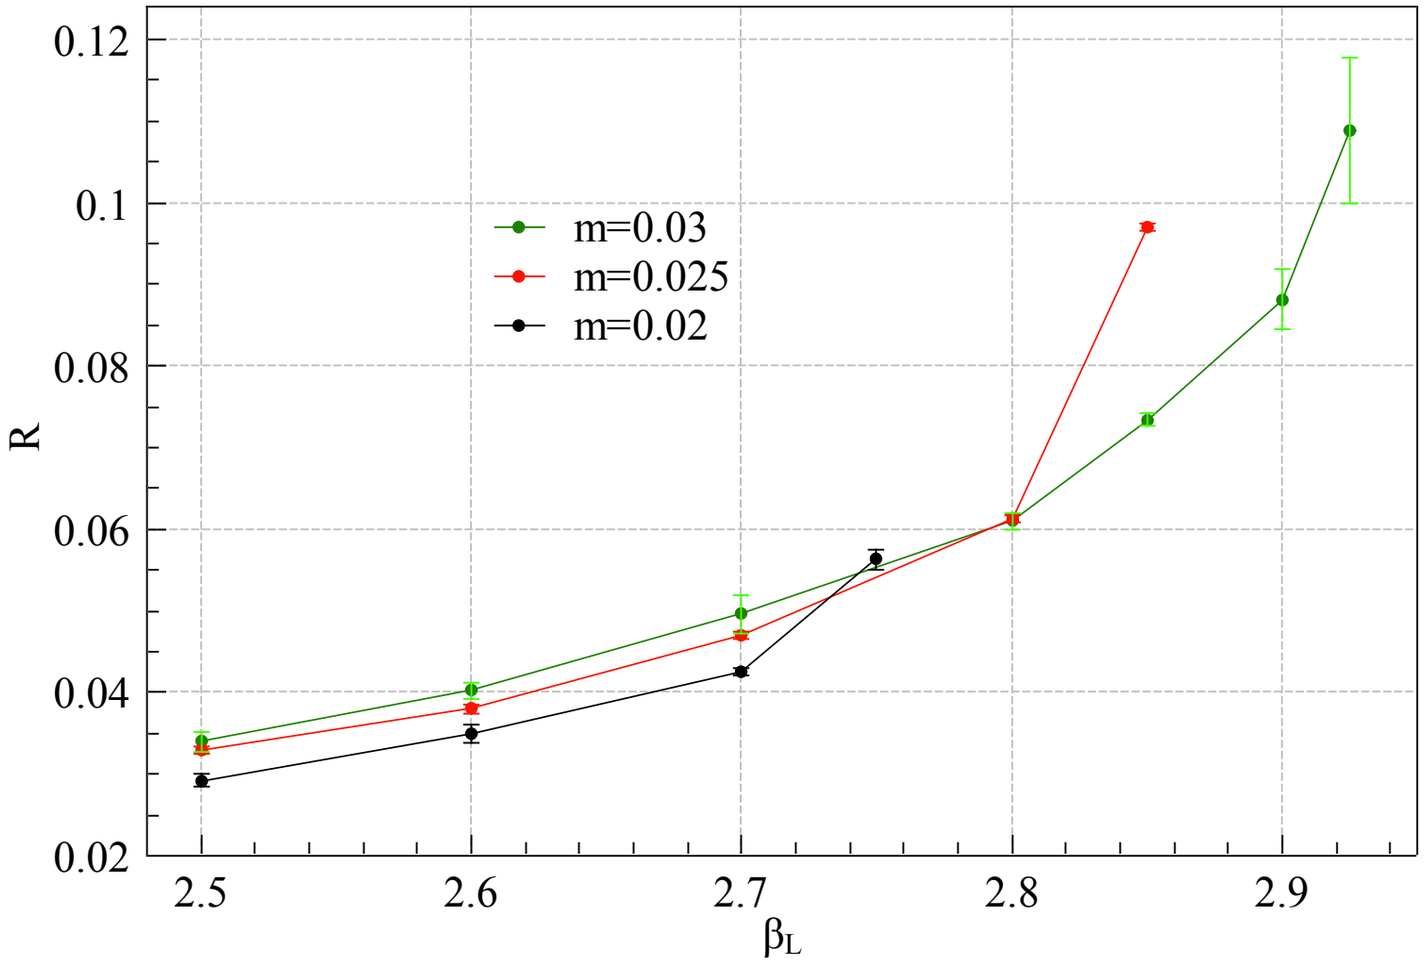
$R \to 1$

π-σ degeneracy

$R \to 0$

π Goldstone

Zoom-in of chiral cumulant

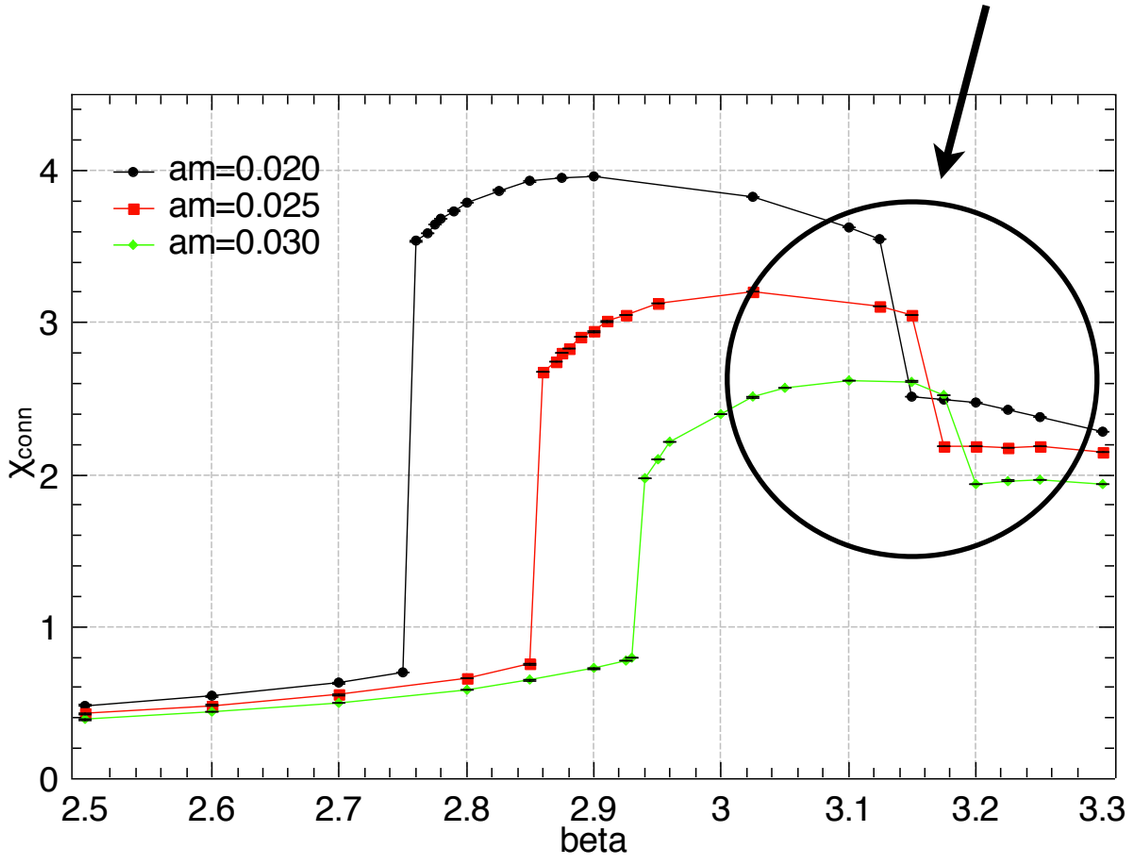


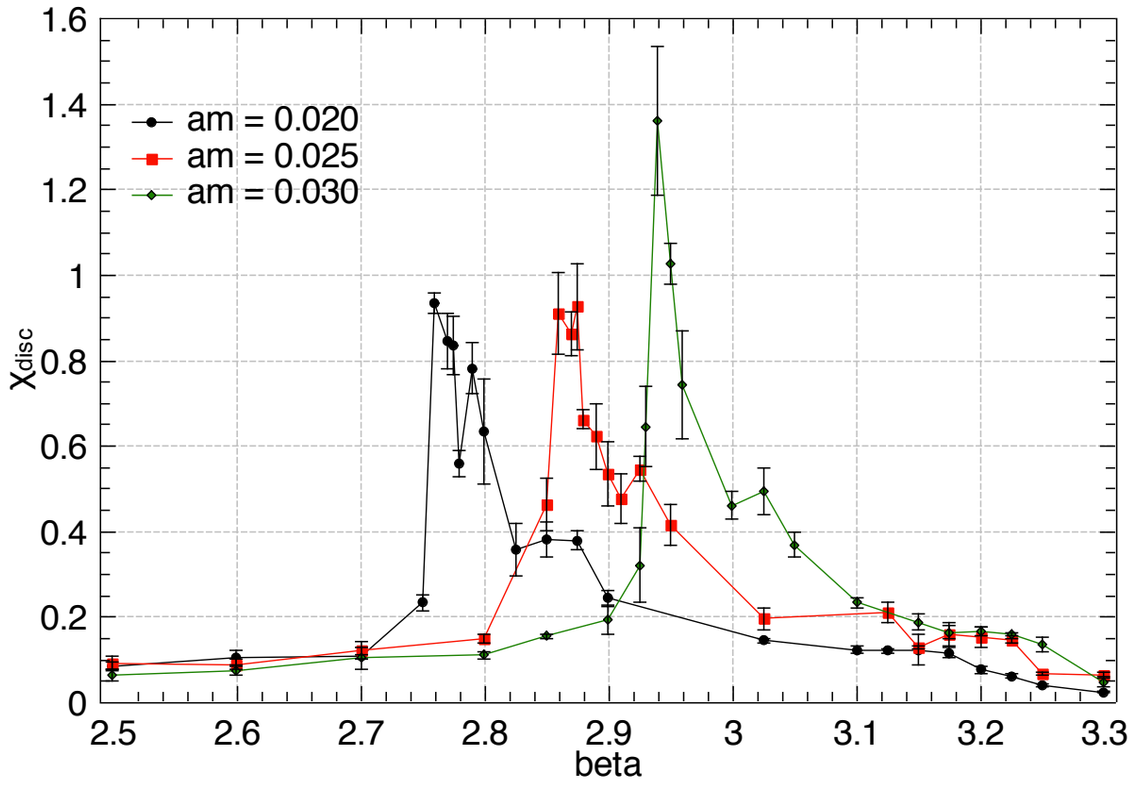
↔

Inversion of mass ordering
at the chiral phase transition

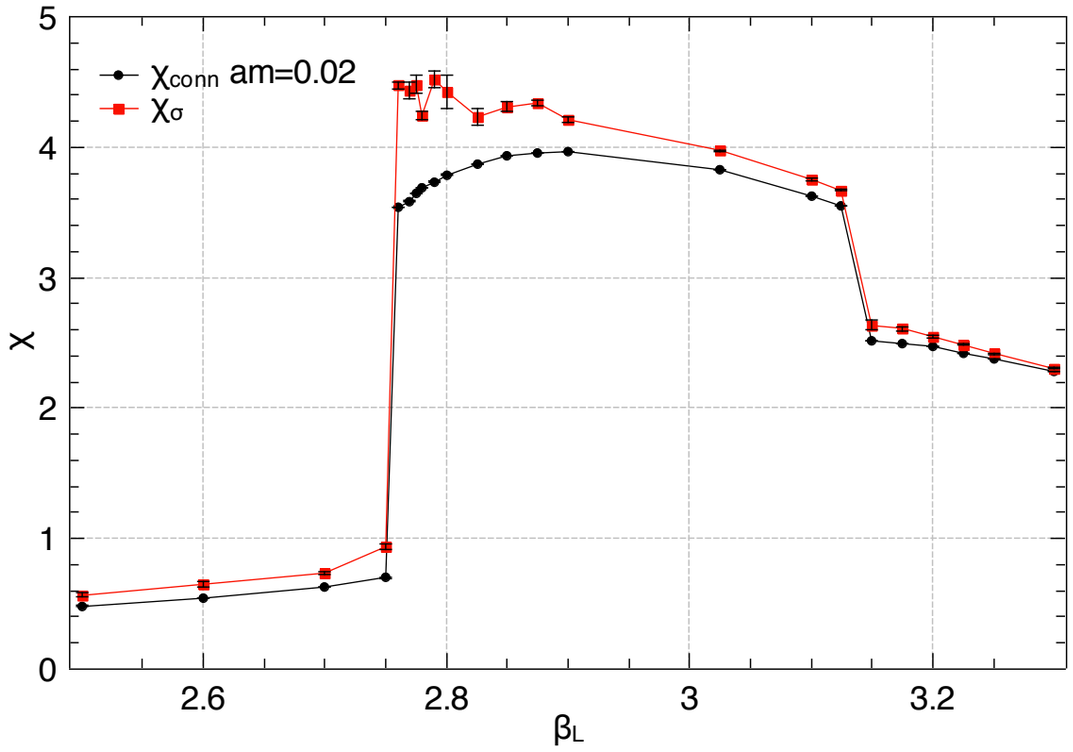
The fate of U(1) axial

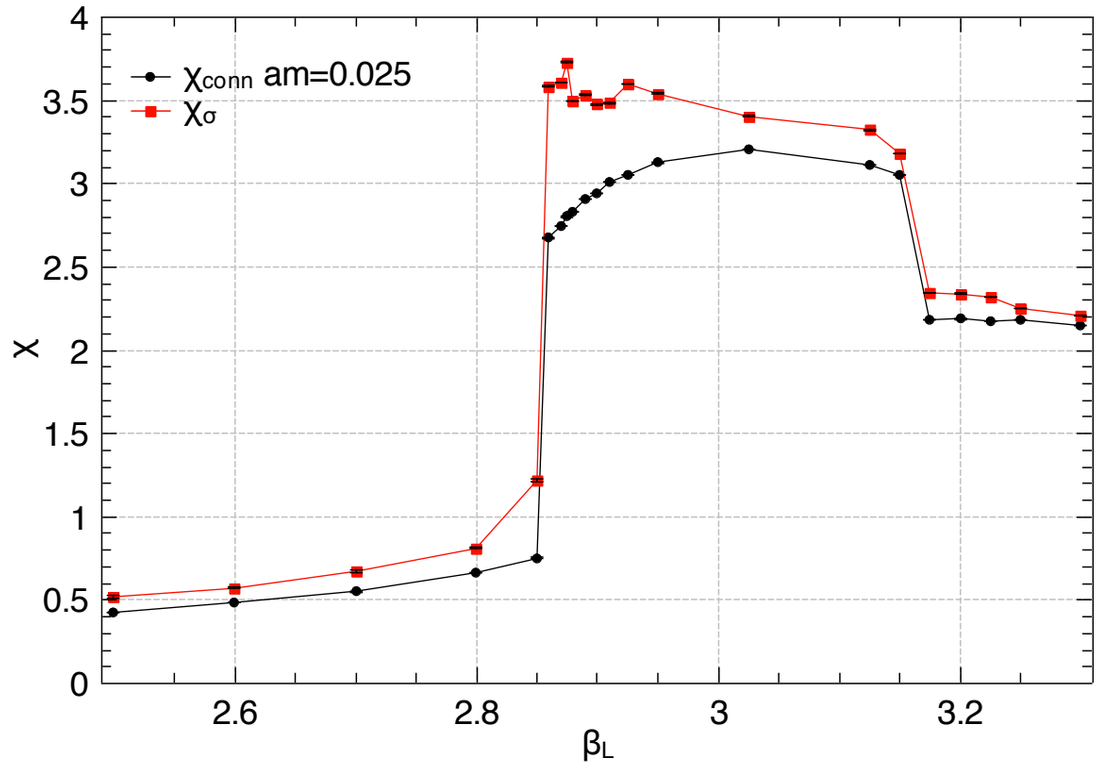
Chiral susceptibilities
mass dependence





Order parameter of U(1) axial





SU(N_f) $\chi_\sigma - \chi_\pi = \chi_{conn} + \chi_{disc} - \chi_\pi \rightarrow$ σ-π degeneracy

$U_A(1)$ $\chi_\delta - \chi_\pi = \chi_{conn} - \chi_\pi \rightarrow$ δ-π degeneracy

Summary: Signatures

The study of symmetries and related phase transitions in the relevant parameter space provides an ideal tool to explore theories inside and outside the CW.

Inside the CW, the absence of (pseudo) Goldstone bosons generates quite distinctive features as compared with QCD.

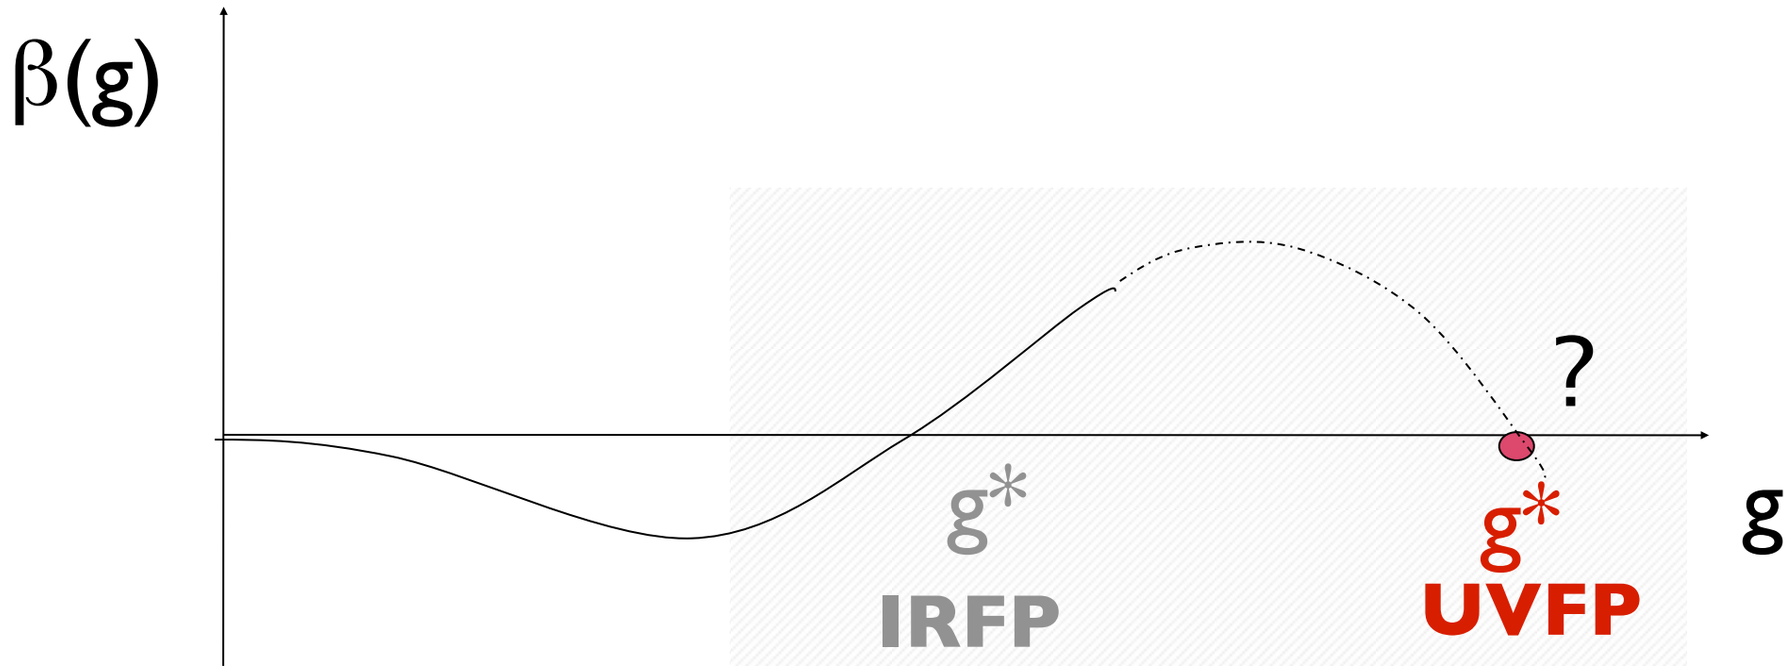
It is appealing the possibility that a UVFP at strong coupling emerges inside the CW, in addition to the IRFP. The first order nature of the chiral bulk transition excludes this possibility for Nf=12. However, a UVFP (second order PT) should appear at the end-point of a line of first order PTs --> end-point of the CW.

The appearance of an additional phase is plausibly related to the partial restoration of U(1) axial separately from the SU(Nf) chiral restoration. Additional effects such as an Aoki phase (staggered taste breaking) may add to this.

AdS/CFT

Disappearance of the CW

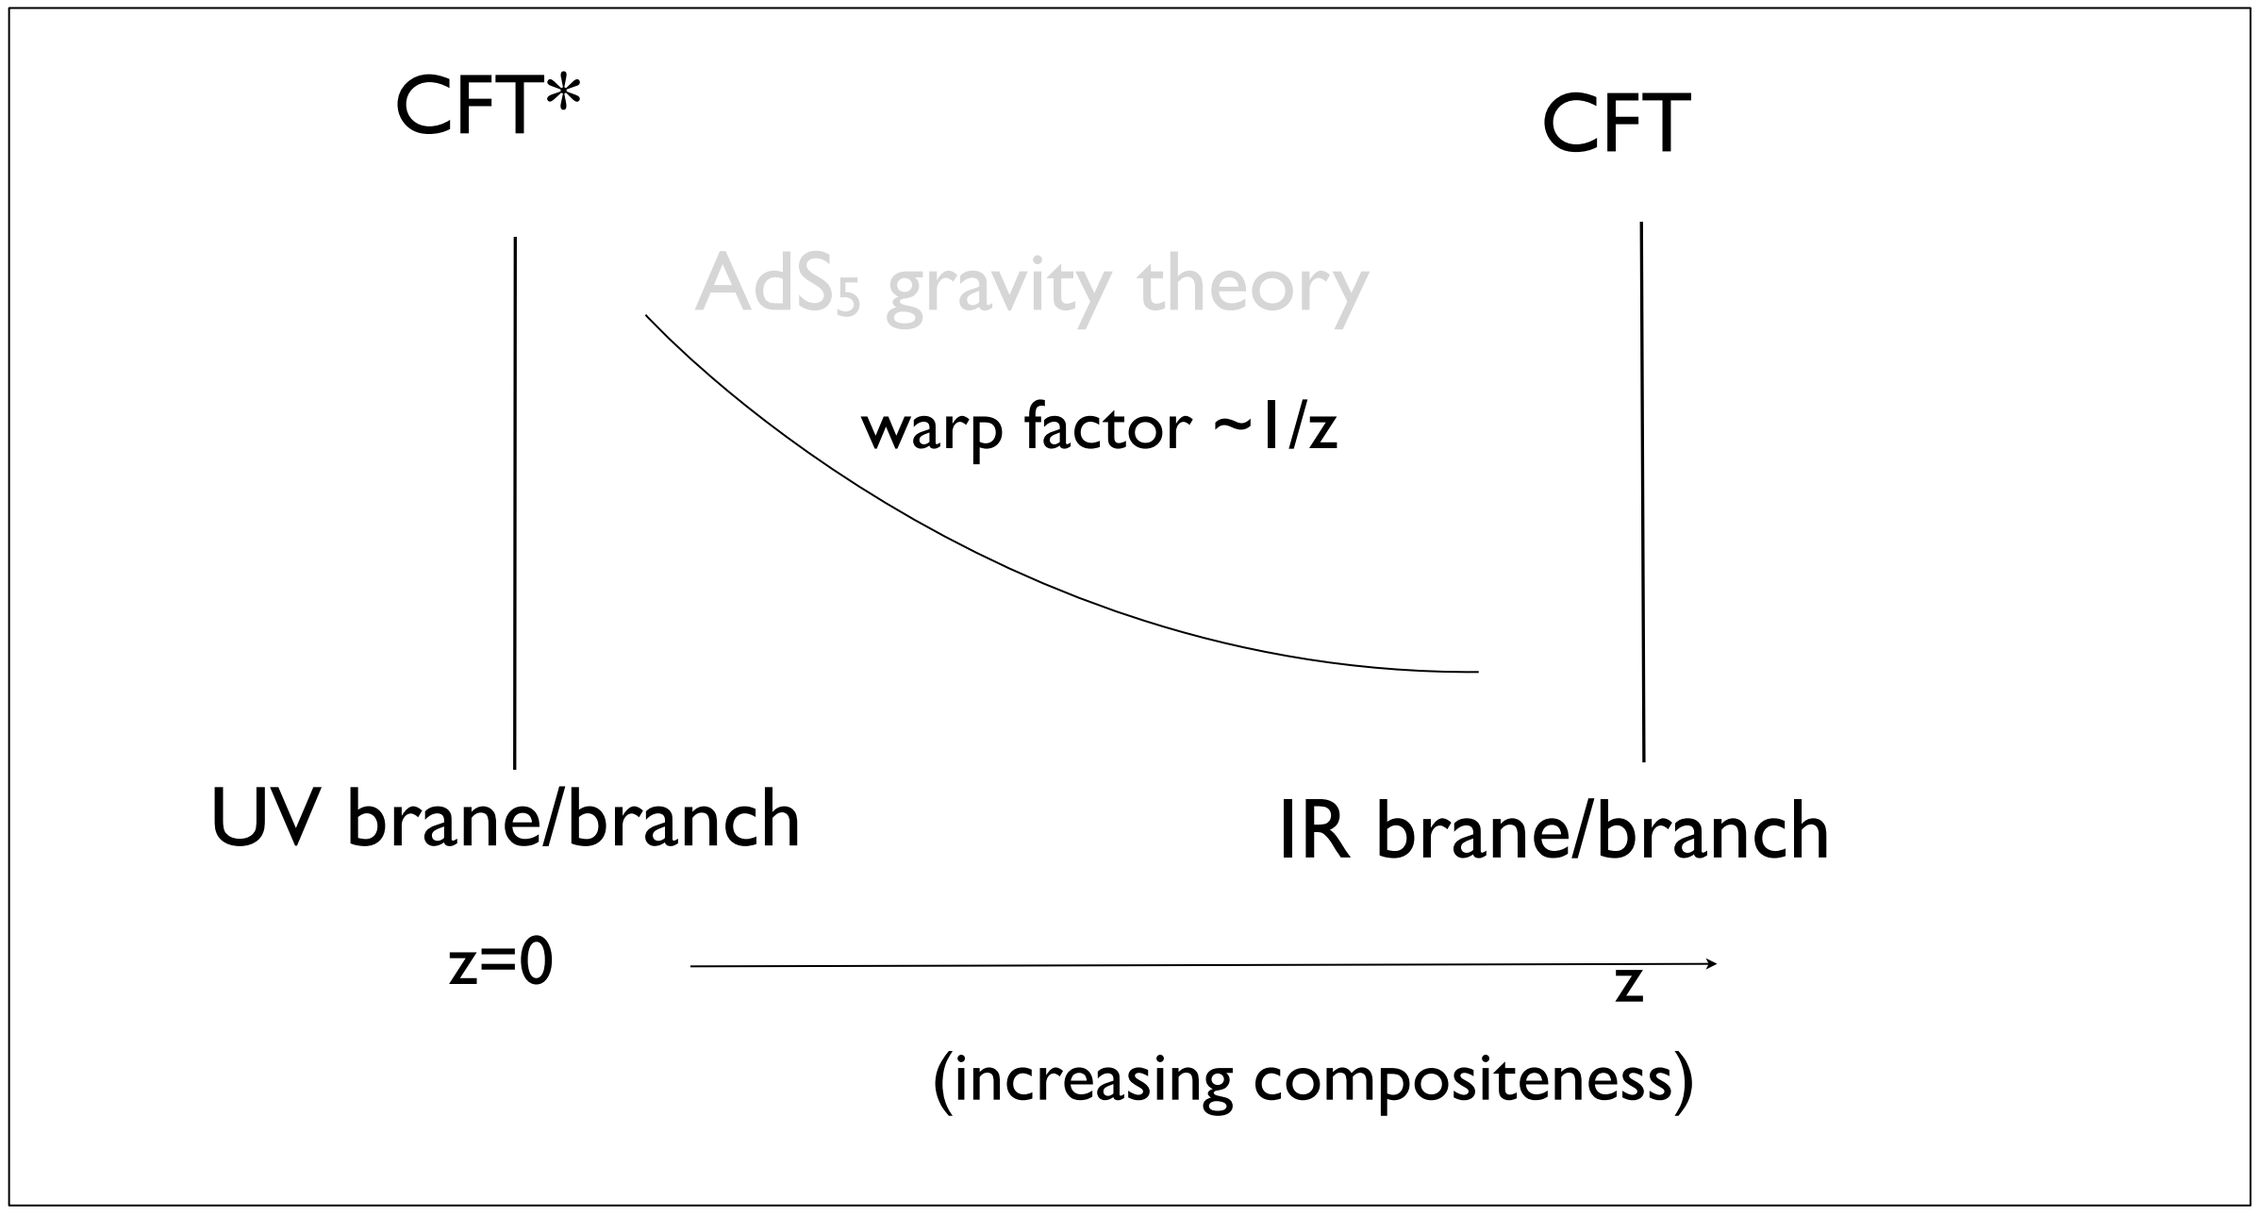
A new viable theory at Strong Coupling?



It suggests the disappearance of conformality via annihilation of a pair of FPs

see Kaplan et al 2009

AdS/CFT



"IR/UV correspondence"

$z \to 0$ IR gravity

$z \to 0$ UV field theory

Duality argument and exact β-function

Seiberg 1995

A conformal window for SQCD must be contained in the region
$3/2\ N_c < N_f < 3N_c$

NSVZ: $$\beta_g = -\frac{g^3}{16\pi^2}\ \frac{3N_c - N_f(1-\gamma_0)}{1-\frac{g^2 N_c}{8\pi^2}}$$

FPs merging in "modified" SQCD?

Found a gravity solution that reproduces the NSVZ β-function of $\mathcal{N}$=1 SYM and confinement Maldacena, Nunez 2004

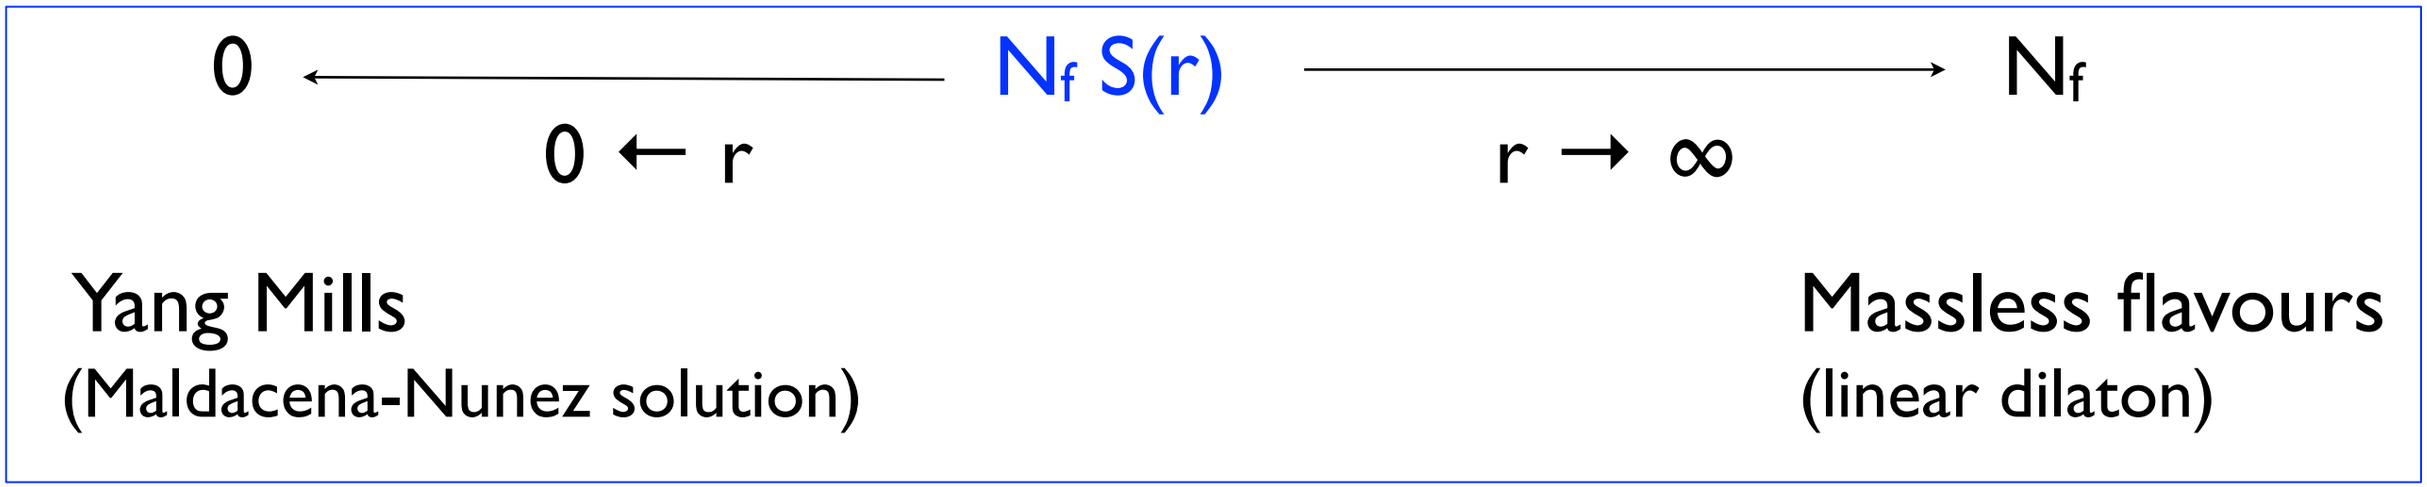
Towards SQCD (large N_f, N_c: N_f/N_c fixed): SUGRA backgrounds

Massless case Casero Nunez Paredes 2008

Massive case (smooth interpolation) Conte Gaillard Ramallo 2011

⇒ SQCD + quartic operators

Mass interpolating function



The β-function from AdS/CFT

Ingredients: gravity solution - gauge coupling relation
energy - radius relation

Limitations: (gravity) singularities ($r \to 0$)

Recent results: Barranco EP Russo 2011

$N_f < 2N_c$ UV limit: $\beta \to \beta_{\rm NSVZ}(\gamma_0 = -1/2)$
IR limit: ordinary confinement

$N_f = 2N_c$ UVFP at strong coupling
$N_f > 2N_c$ Seiberg dual ($N_c \to N_f\text{-}N_c$, $N_f\text{-}2N_c$ flips sign)

Summary

Strongly coupled (quasi)conformal gauge theories might play a role in particle physics BSM

Large-Nf QCD is an instructive example

Conformal window opens around $N_f \sim 12$

Spectrum and phase transitions provide distinctive signatures of the conformal window

AdS/CFT suggests a unified view where 4D theories of particle physics are dual to gravity theories in AdS_5

AdS/CFT in phenomenology: warped RS1 models
AdS/CFT as a mathematical tool: FPs merging?

A UVFP is found at strong coupling for $N_f=2N_c$ in a class of gravity solutions dual to SQCD plus higher dimensional operators.
