

Nuclear Emulsion and Its Readout System

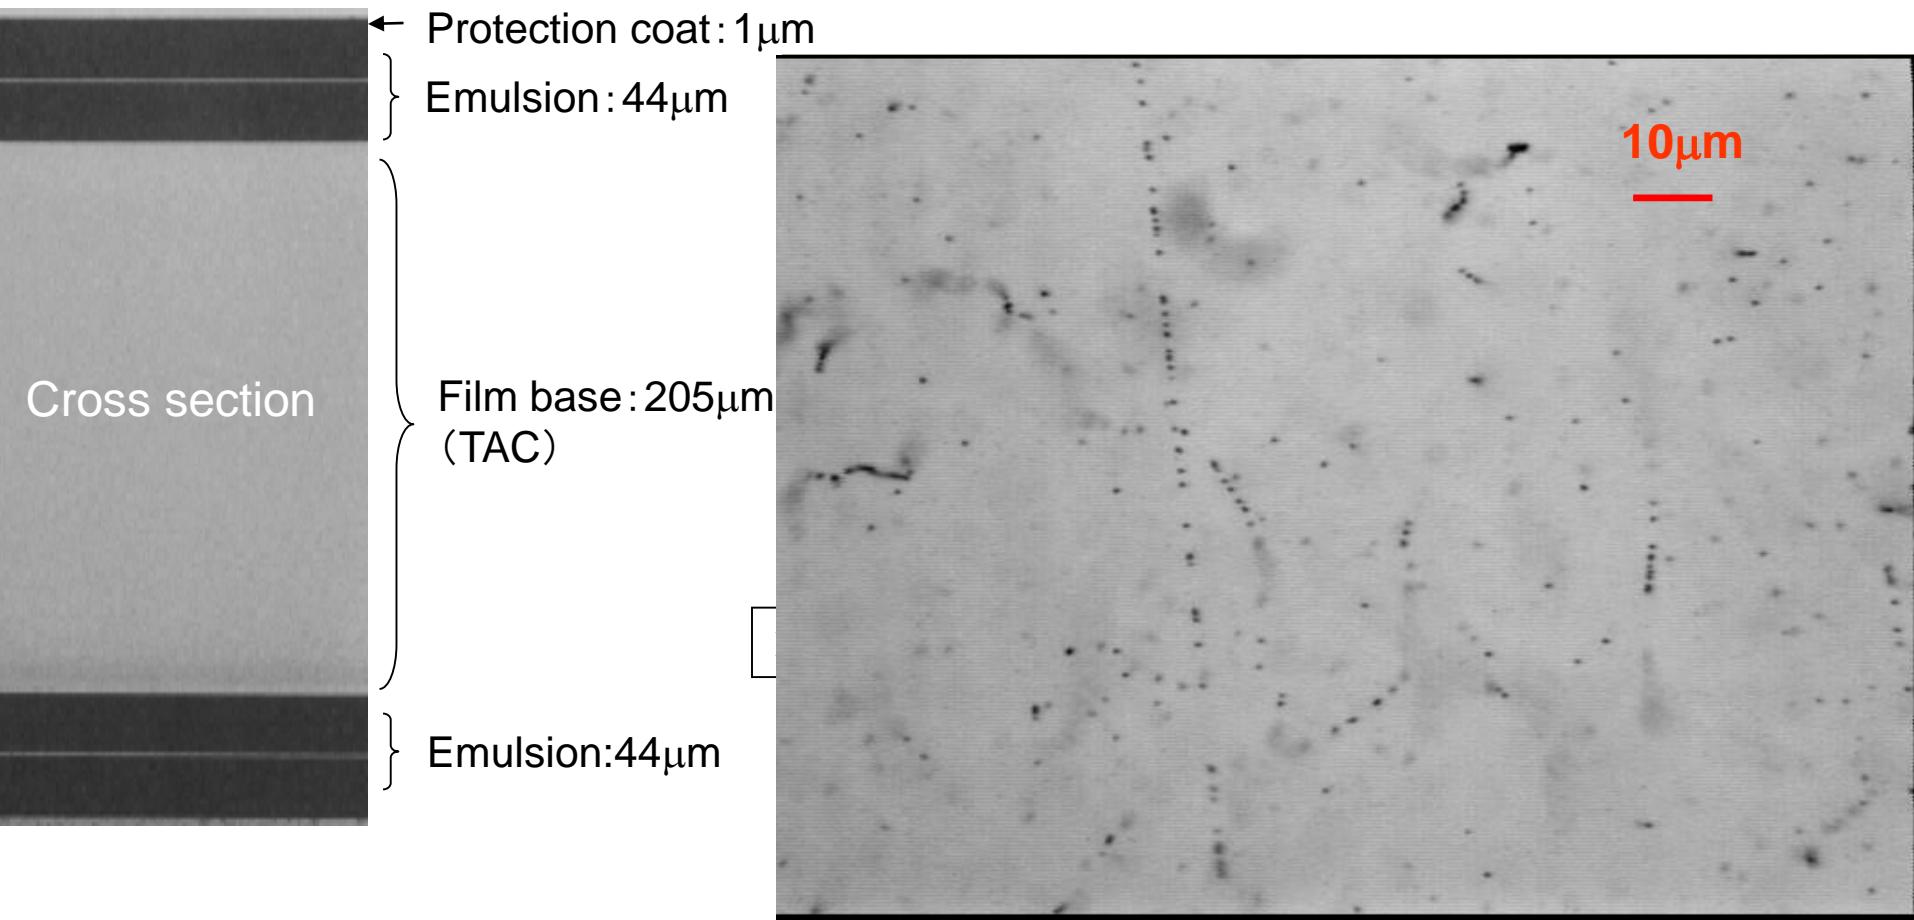

Toshiyuki Nakano
Nagoya university

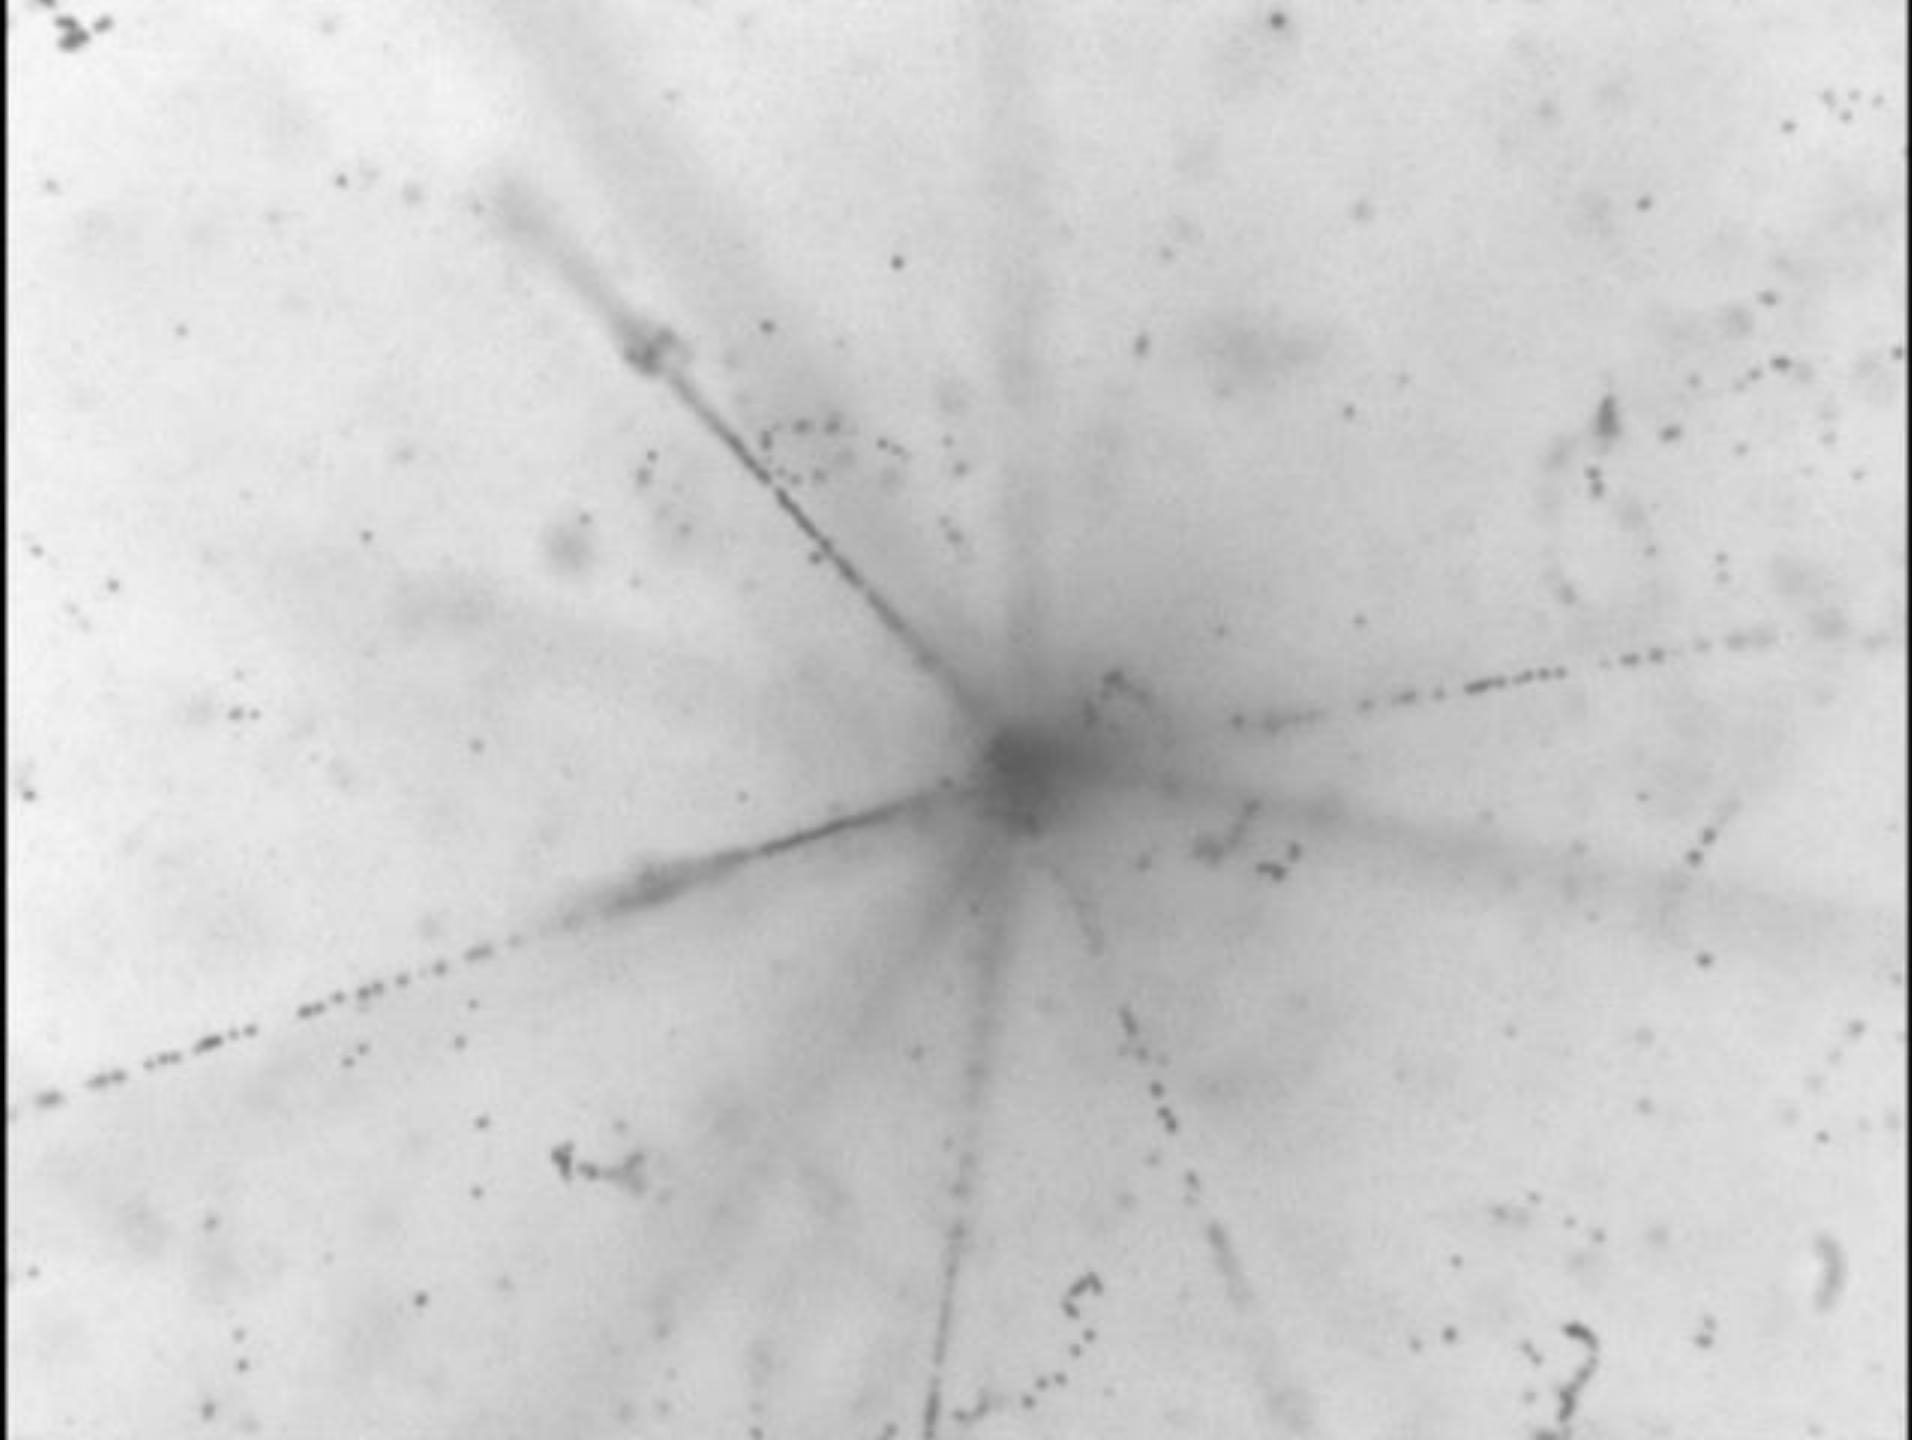

Nuclear Emulsion Film

- Very high spatial resolution.
- Possible to record MIP's tracks

“OPERA film” is uniform, refreshable and mass producible.

~100,000m² are used in OPERA

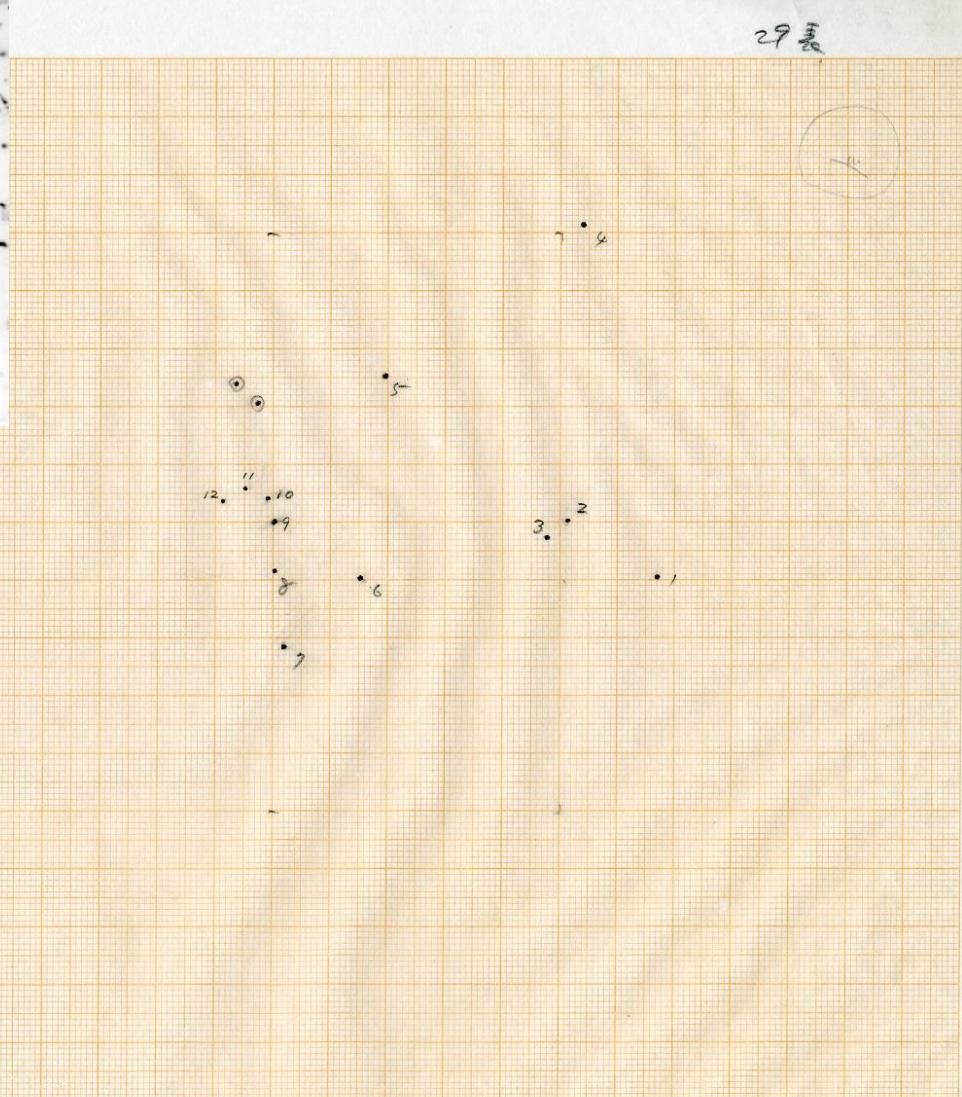

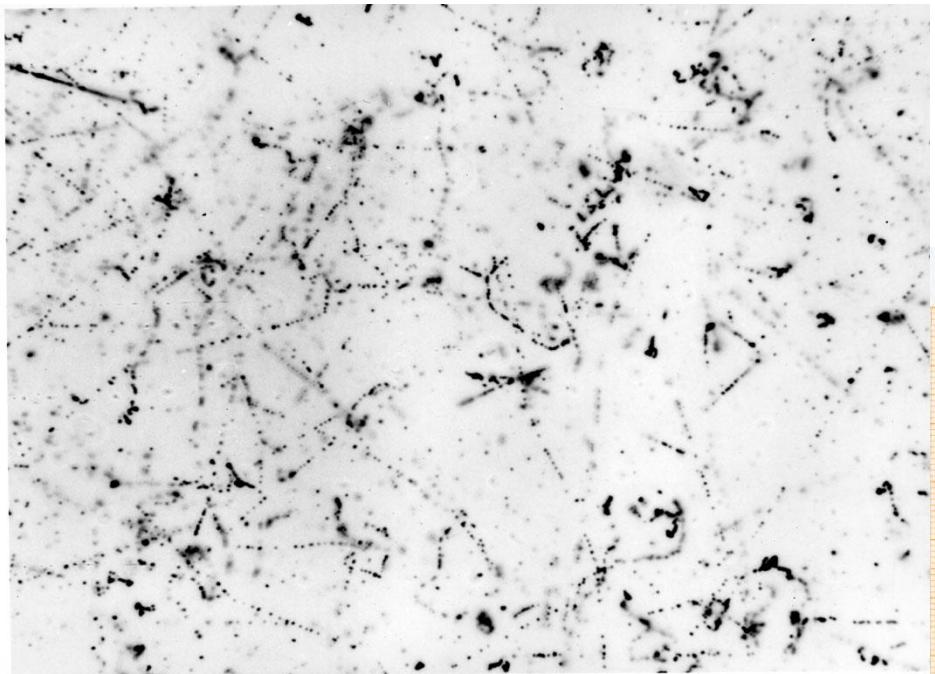

Prof. Niu's effort

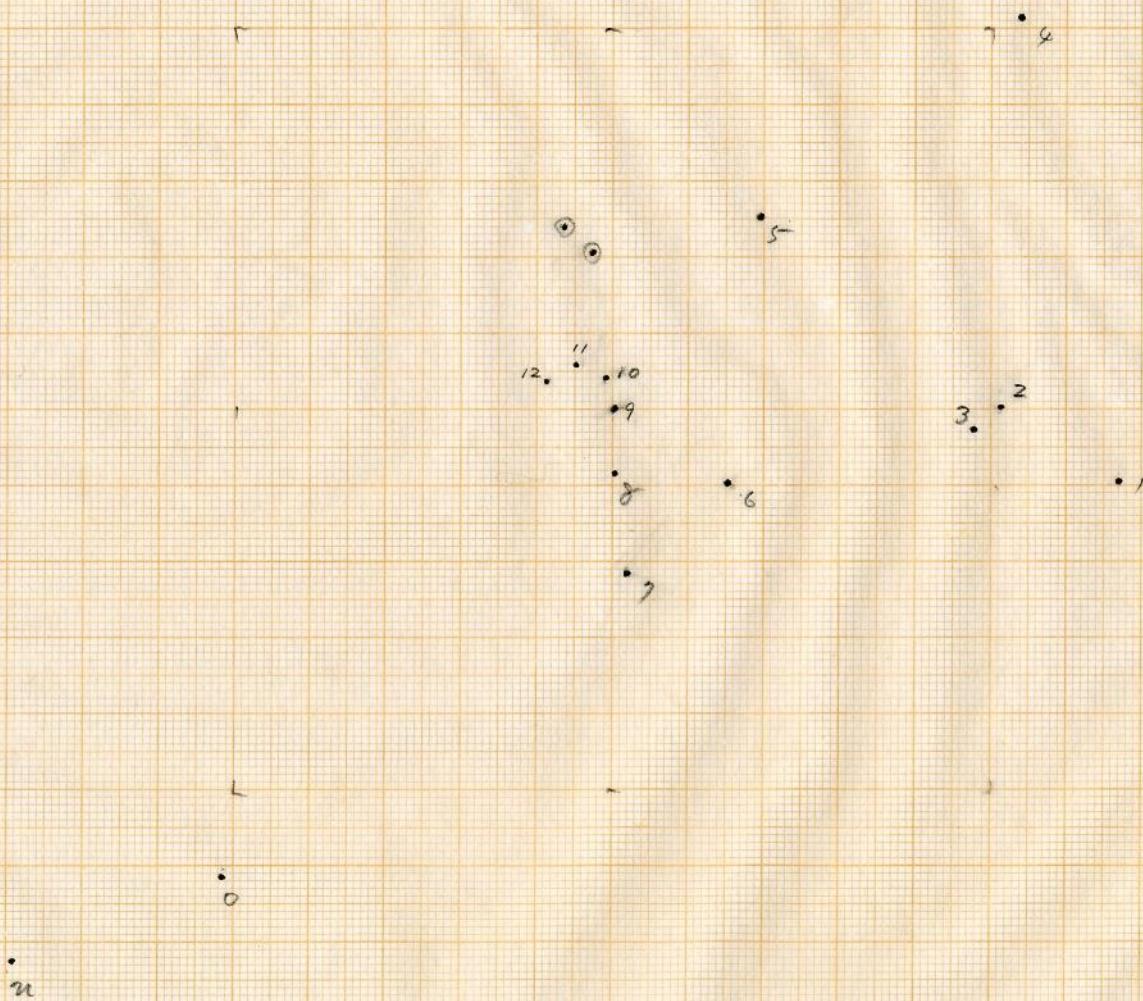

- 2-3 events / Half year
- Emulsion analysis by Eye and Hand

Automated Emulsion Read-out system

- Principle was proposed by K. Niwa in mid. 70s.
- The first system construction in 1983.
- The first application to real experiment in 1994.
CHORUS (CERN WA95)
- The latest version “SUTS” was developed and applied to
OPERA experiment.
 - The current speed of SUTS is $72\text{cm}^2/\text{hrs}/\text{side}$

Polarity Measurement

Microscopic view of a pair creation

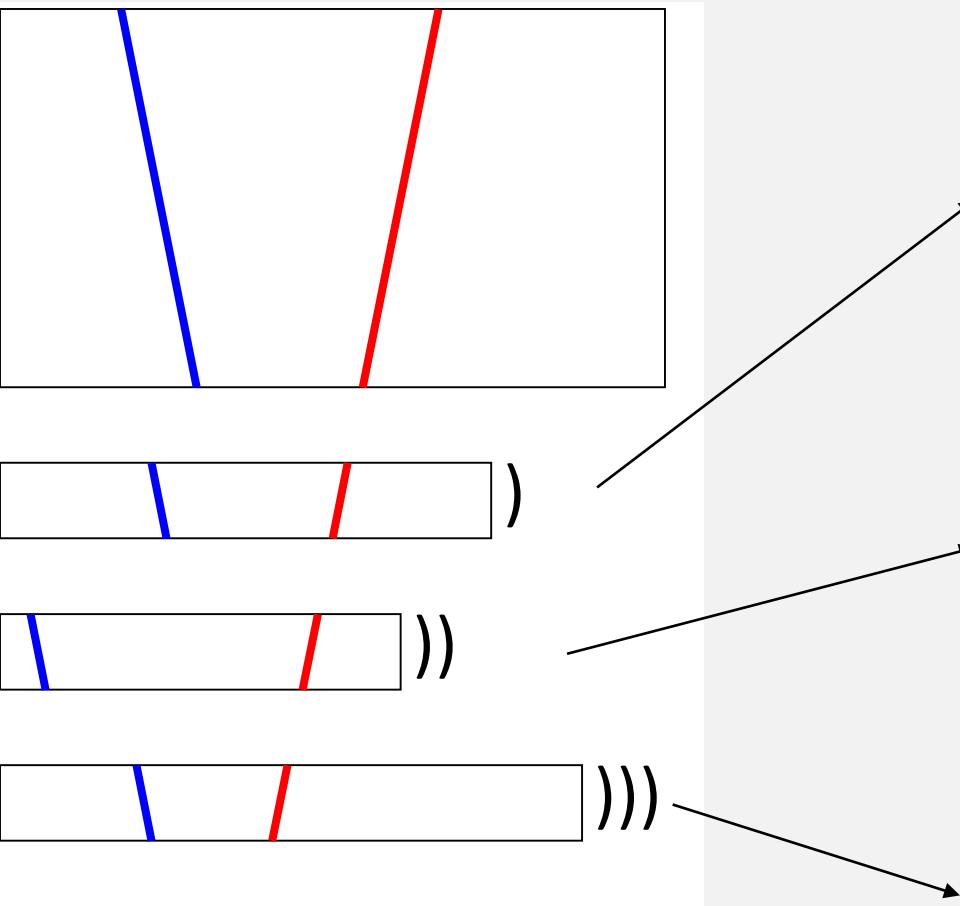

Azimuthal Distribution

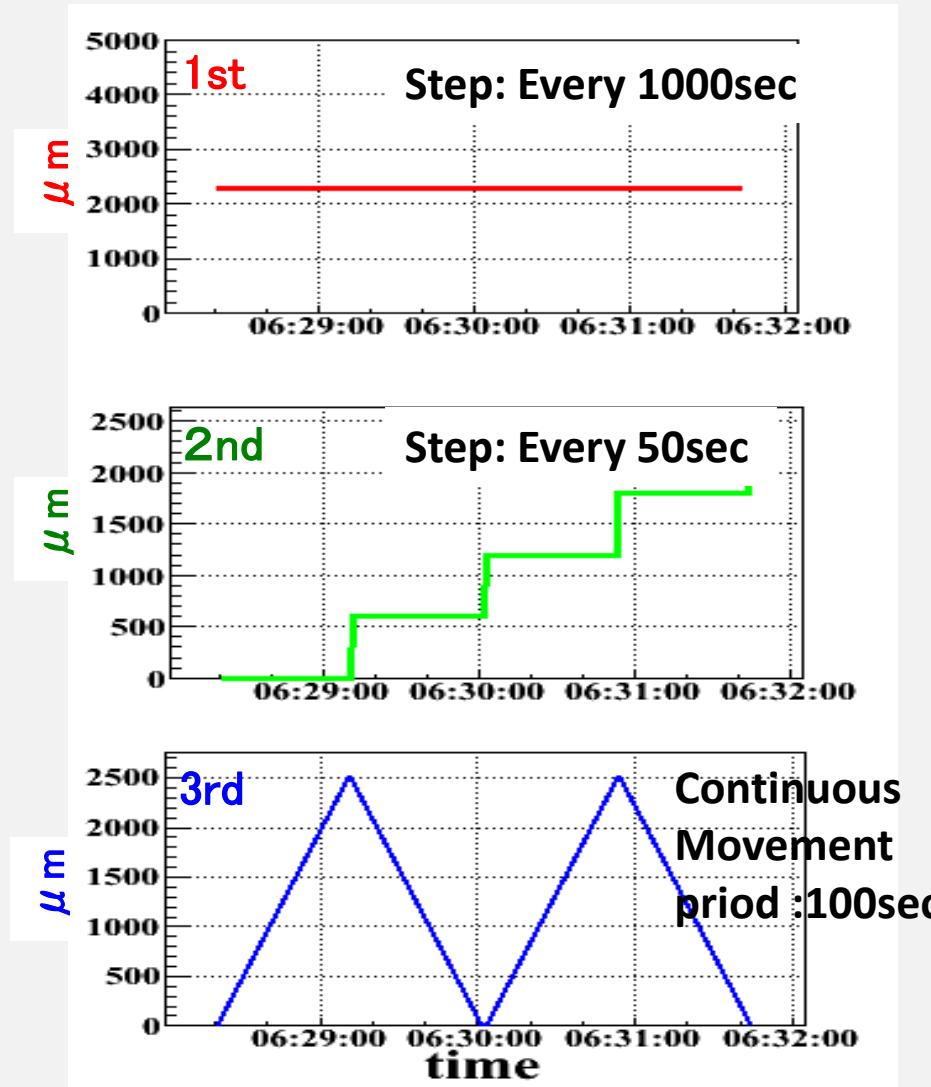

GRAINE can measure the Polarity
(Proven by 3.5σ)
Fermi : impossible

Time Stamp System = Shifter

Aim to resolve 10 msec

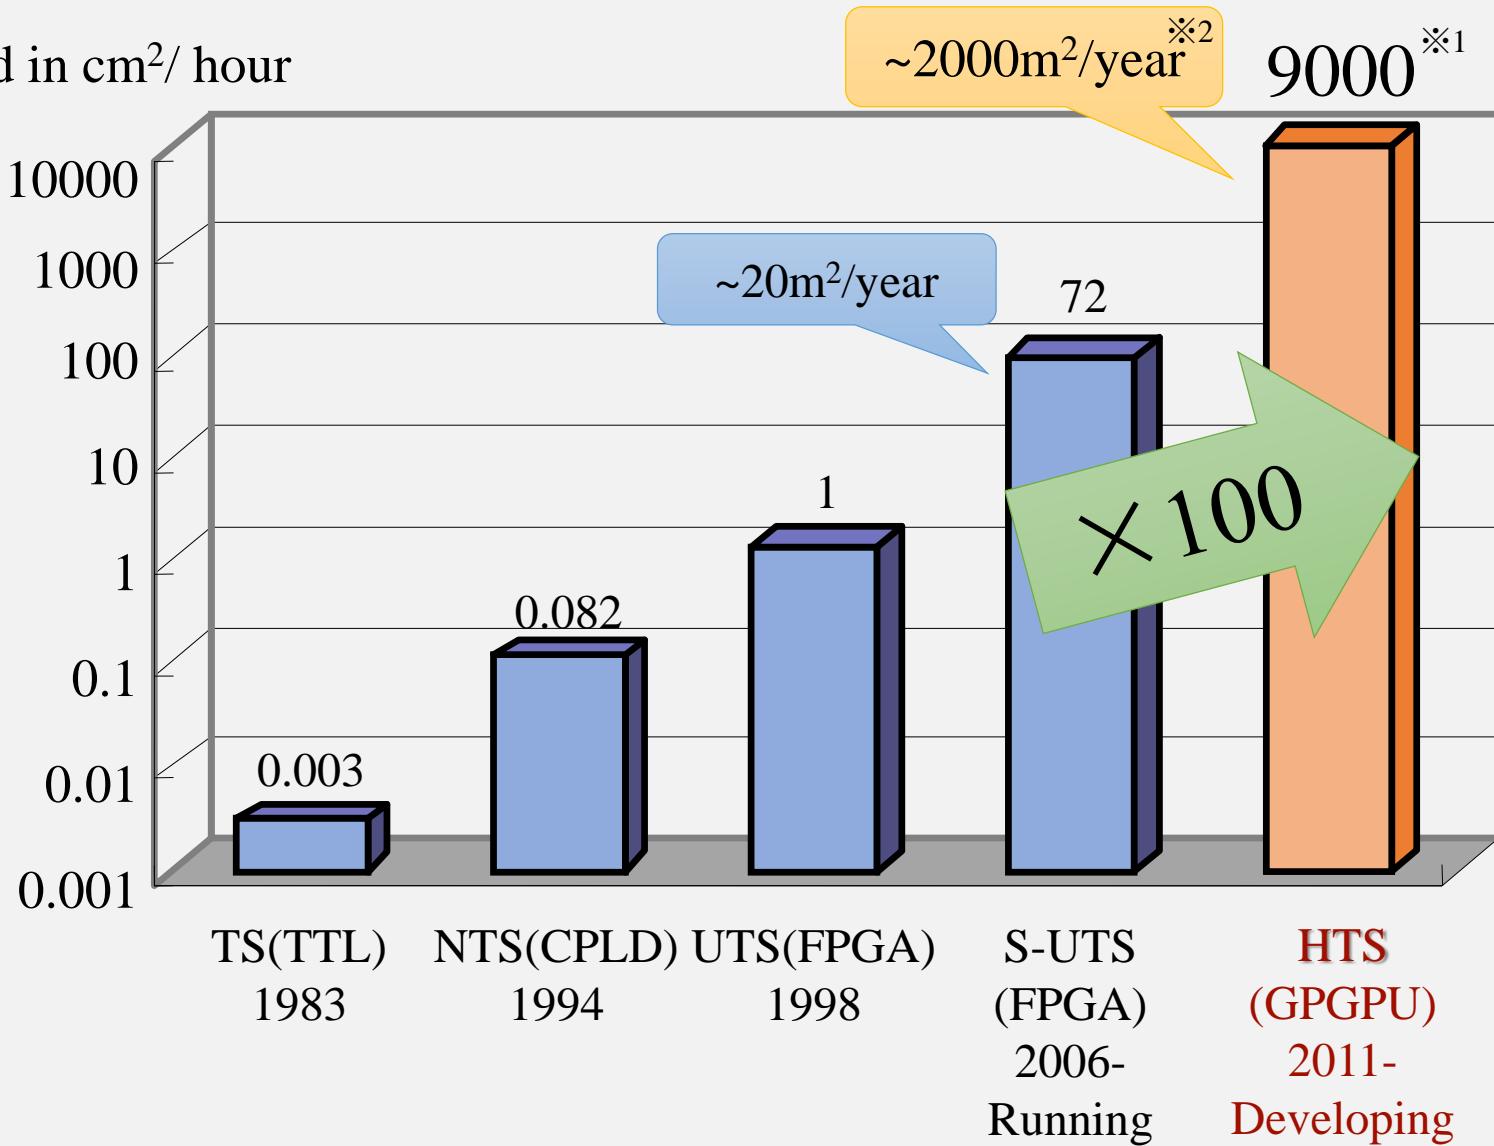

A scanning speed of $1000\text{m}^2/\text{year}$ or more is required.

Two orders of magnitude faster.

Evolution of the Scanning Speed

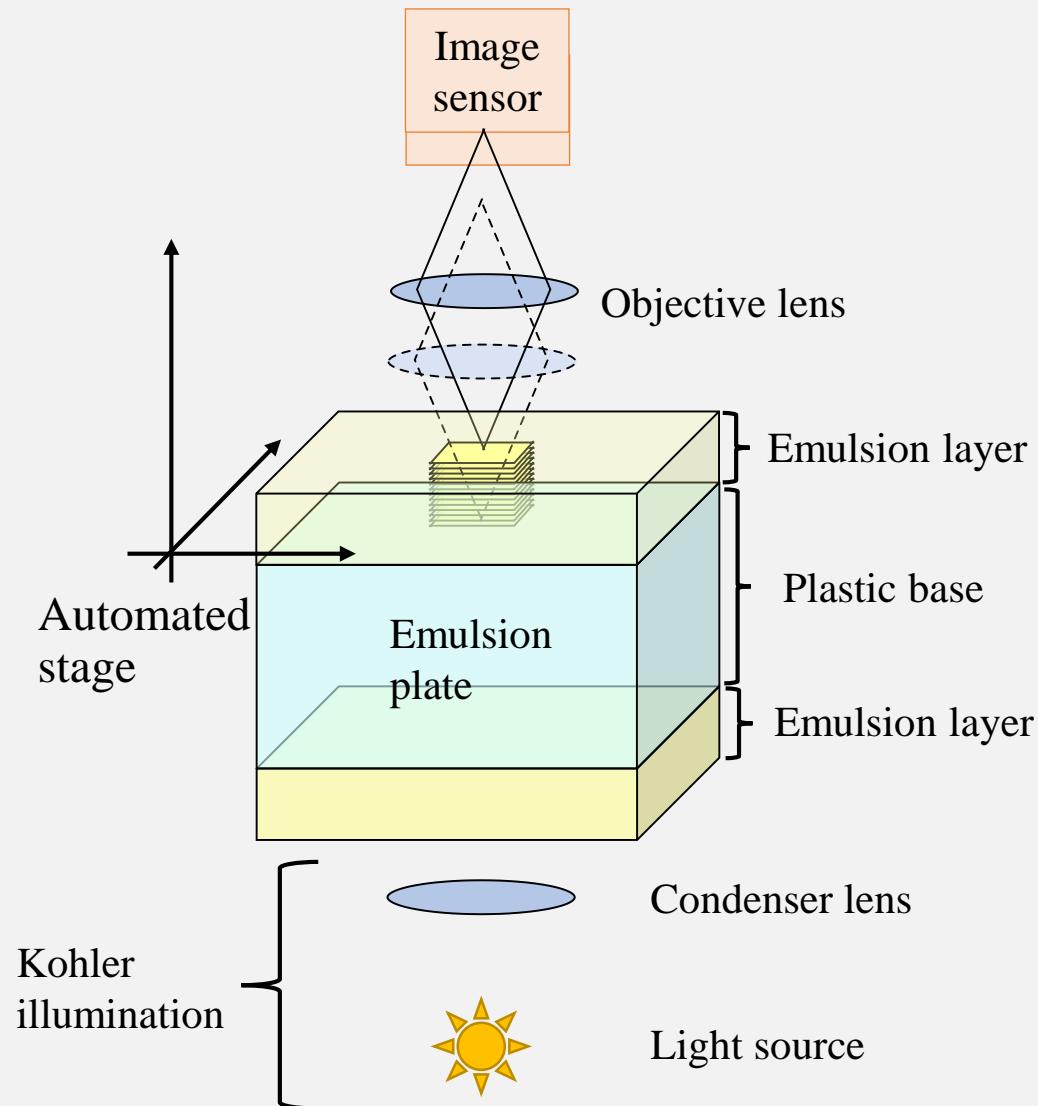

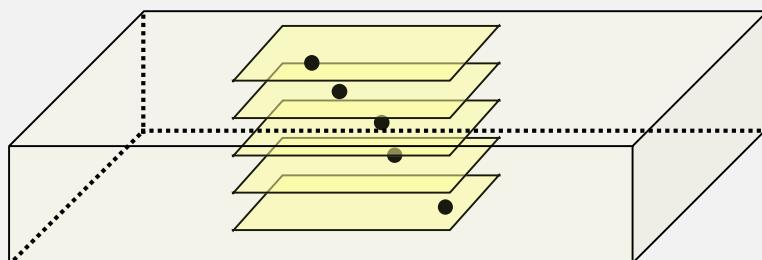

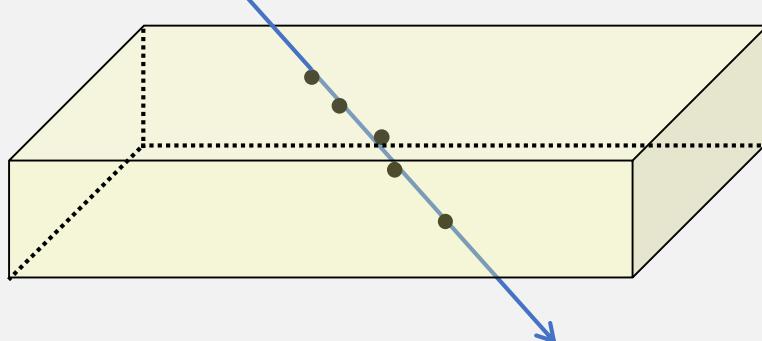

※1 Area of each layer
※2 Area of the films

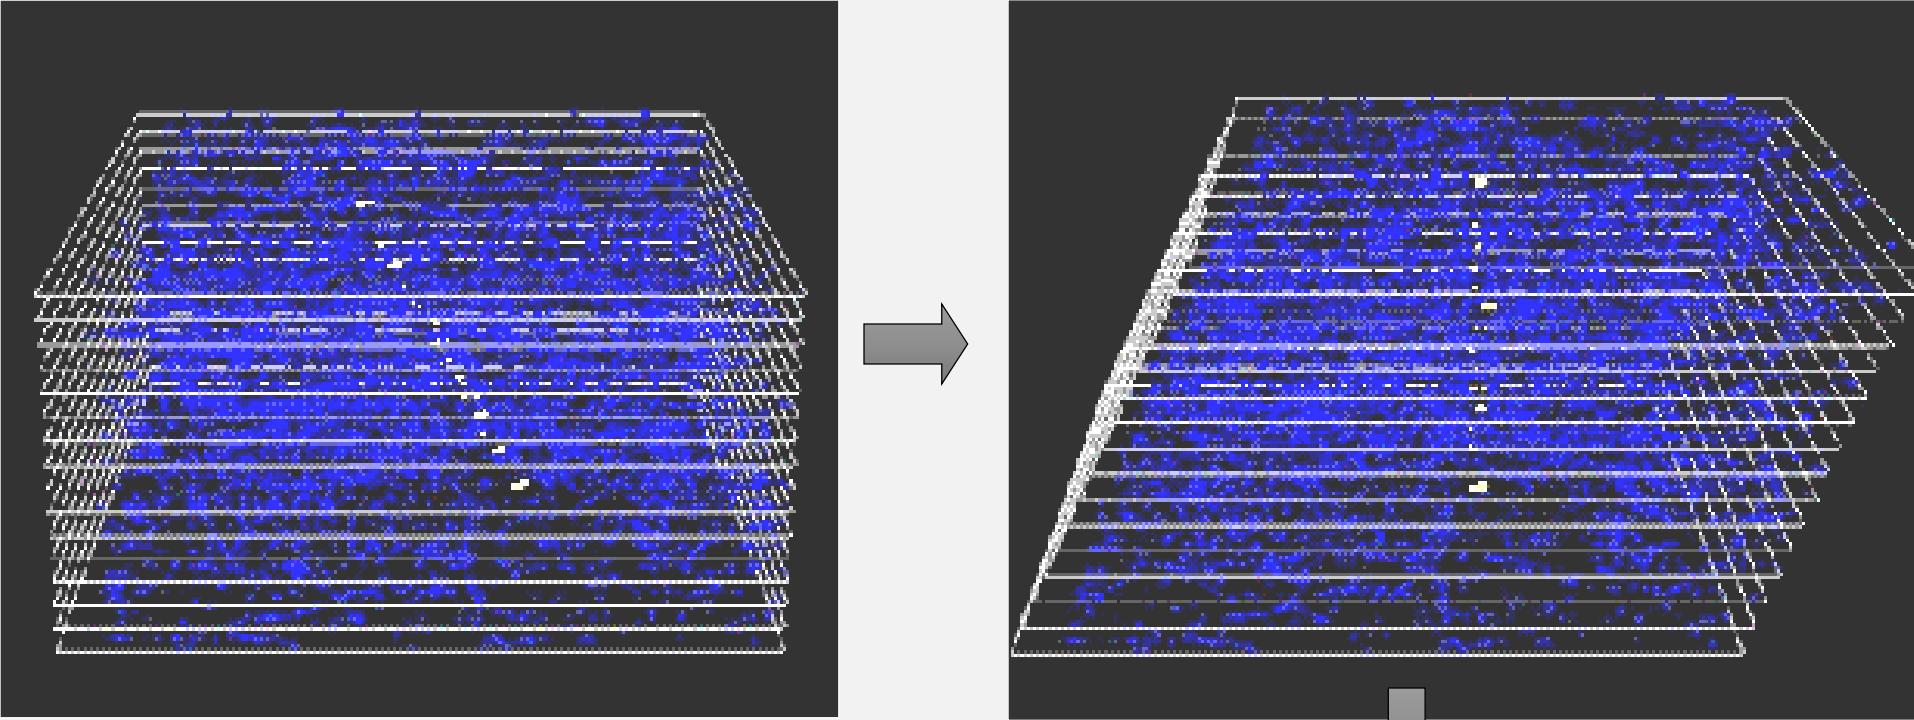

Speed in cm^2/hour

Digitizing Nuclear Emulsion

Charged particles

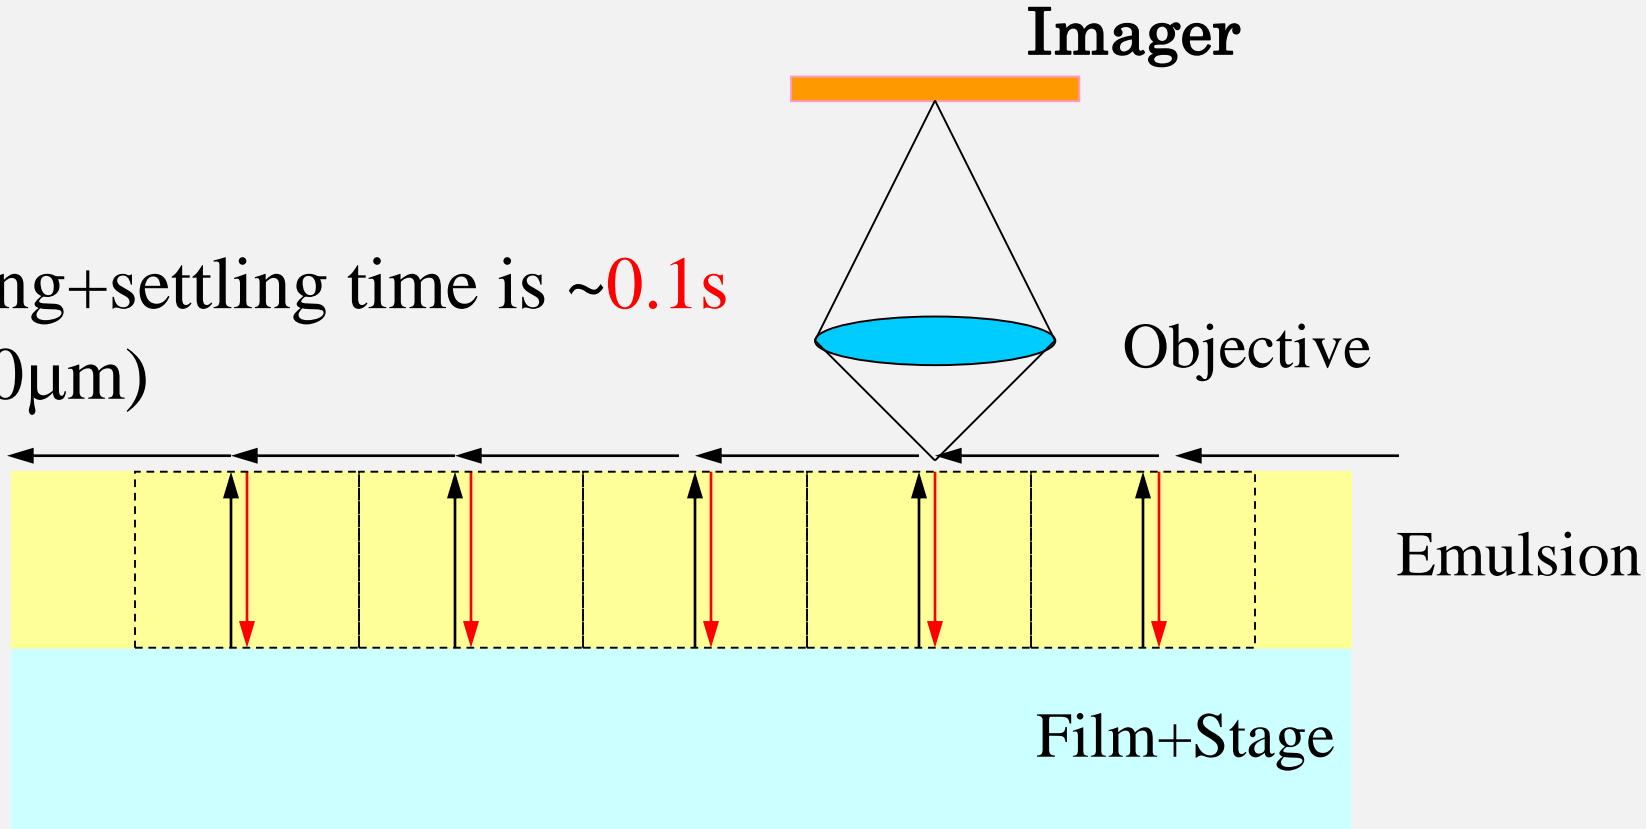

Track recognition method

- Take 16 tomographic images by microscope optics.
- Shift images to aim at specific angle tracks.
- Sum up 16 images to examine coincidence.
- Find signal of tracks. ----->
- Repeat for all angles in space, >2000 times

Invented by K. Niwa in 1974

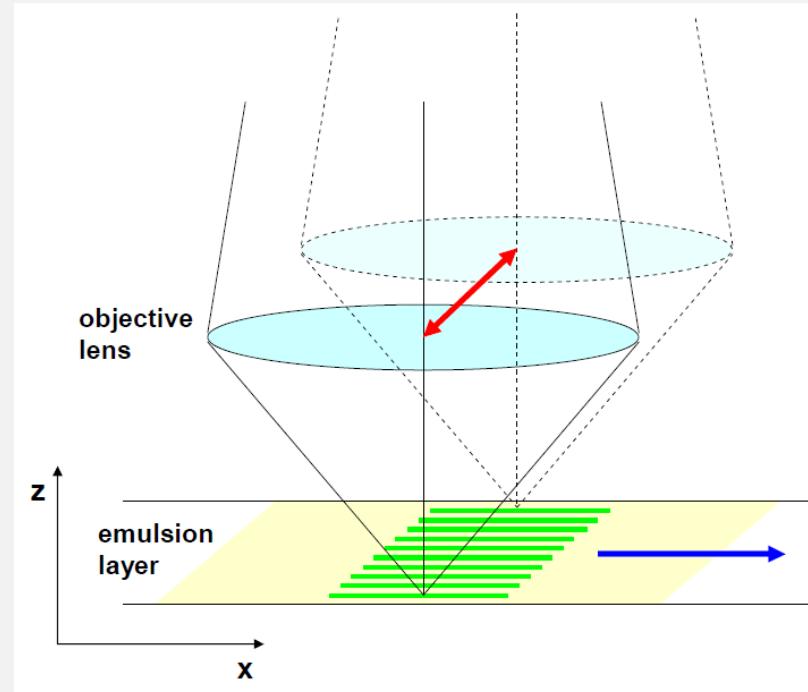

Mechanics is also the bottleneck

Driving+settling time is ~0.1s
(~200μm)

The features of the previous system “SUTS”

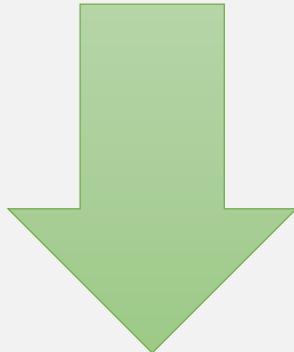

- Ultra High Speed Camera
 - Up to 3k frames per second.
 - 60 view/sec (20times)
- Image taking by follow shot
 - No step and repeat operation can avoid a mechanical bottleneck.
 - High speed motion of the objective lens can be done by piezo actuators
- Optimizing Field of View
 - $120\text{mm} \times 90\text{mm} \rightarrow 200\text{mm} \times 200\text{mm}$ (4 times area)
- FPGA for image processing

Maximum scanning speed is $72\text{cm}^2/\text{h}$

Concept of HTS (Hyper Track Selector)

- It is difficult to drive objective much more quickly.

- Field of view can be a few orders of magnitude larger.

**Parallel Processors
72 GPU + 36 CPU**

Wide View Lens

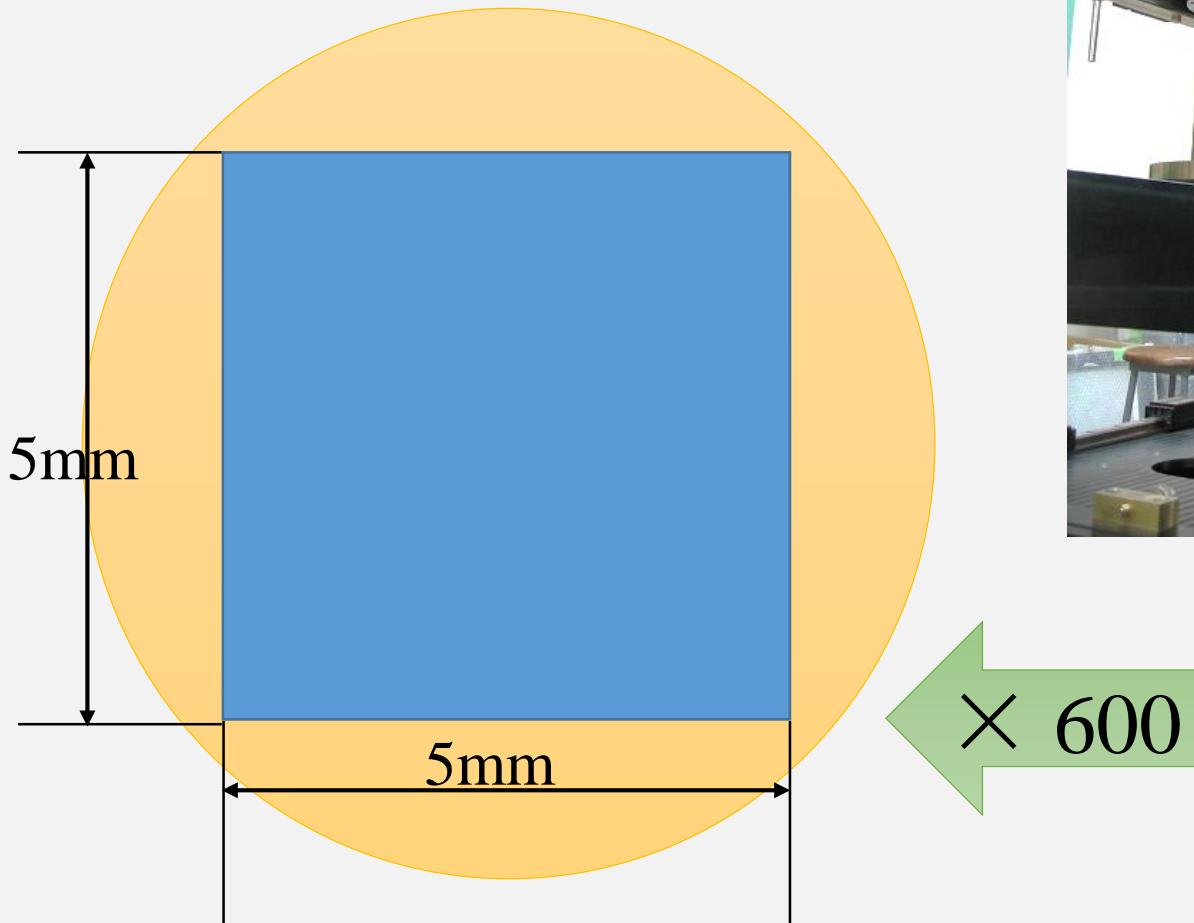

**72ch Camera
2M pixel/Camera**

**High Precision
X-Y-Z Stage**

**New Read-out system HTS
(Hyper Track Selector)**

Wide field of view

Field of view (FOV) of HTS

S-UTS
x 600
~0.2mm

Big Objective Lens

Resolution : ~420nm

N.A. : 0.65

Light source : g-line (436nm)

Magnitude : ×12.2

F.O.V : 5.1 (H)×5.1 (V)mm

#of image plane 6
(by Beam splitter)

Weight : 80kg

Resolution : “Numerical Aperture”

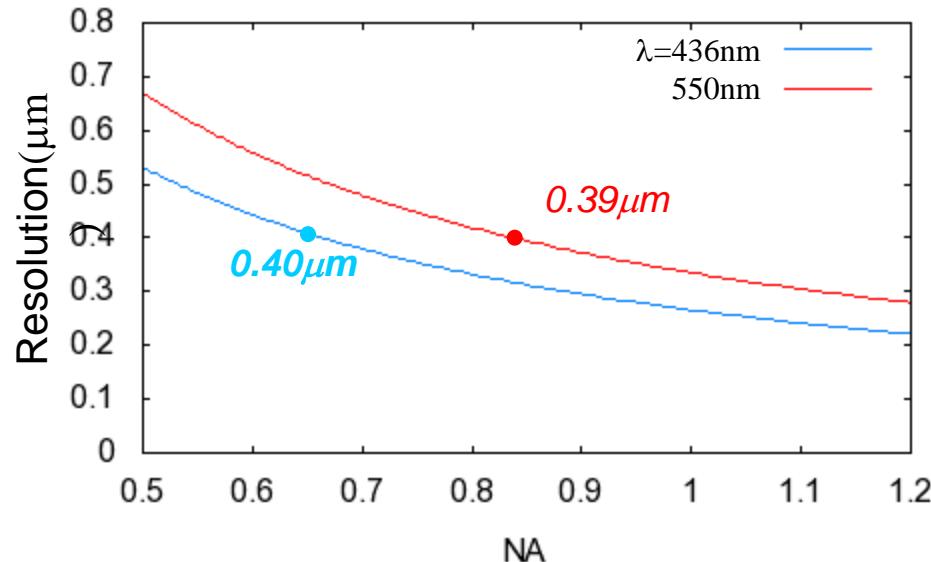

- Spatial resolution :

$$R_{res} = 0.61 \cdot \lambda / NA$$

NA=0.65, $\lambda=436\text{nm}$: $0.40\mu\text{m}$ HTS

NA=0.85, $\lambda=550\text{nm}$: $0.39\mu\text{m}$ SUTS

No significant difference

- Depth of field :

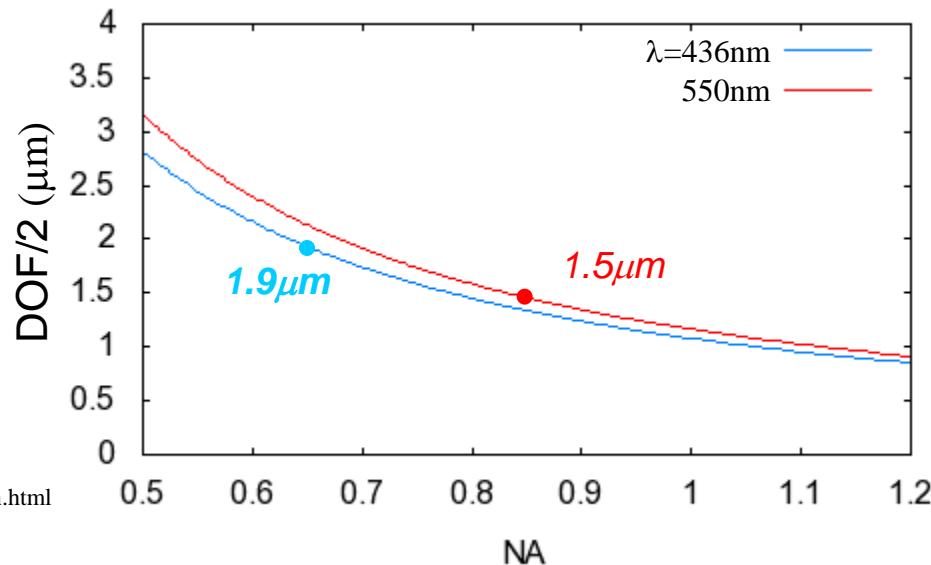

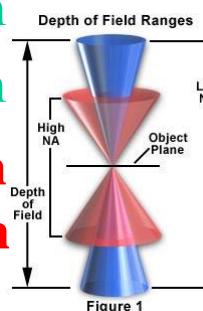

$$DOF = \frac{1.0}{n/NA + n \cdot \lambda/NA^2}$$

Circle of confusion (Modified BEREK formula)

NA=0.65, $\lambda=436\text{nm}$: $\pm 1.9\mu\text{m}$

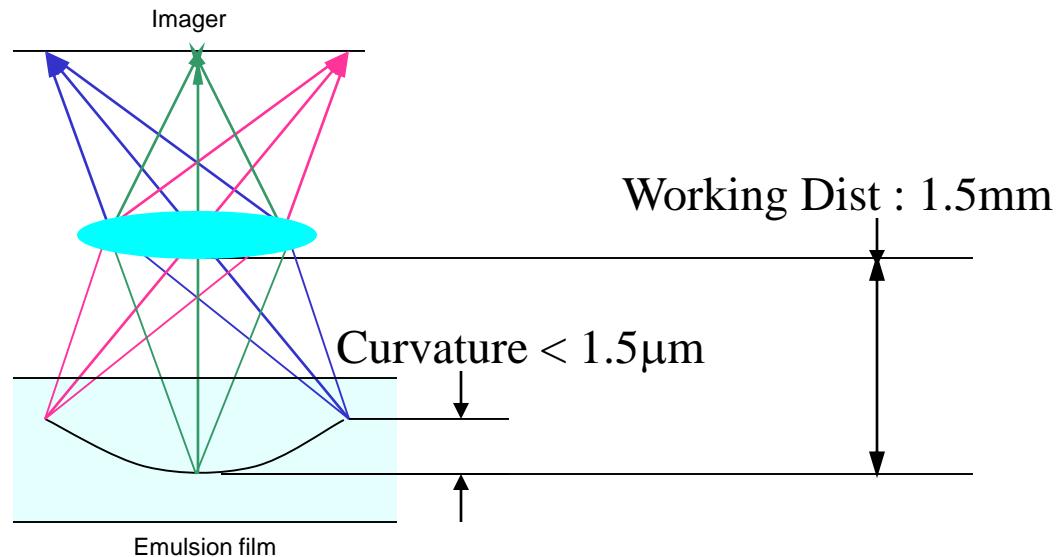

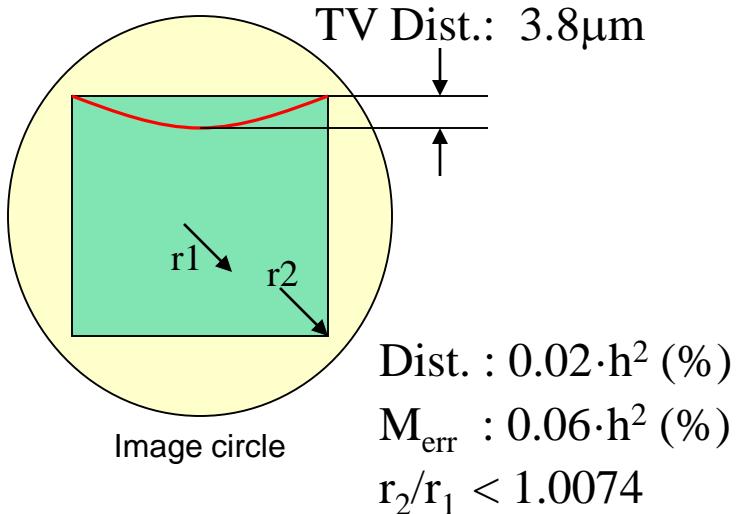

NA=0.85, $\lambda=550\text{nm}$: $\pm 1.5\mu\text{m}$

27% worse, however emulsion thickness can be adjusted even after developing.

Distortion (Optical aberration)

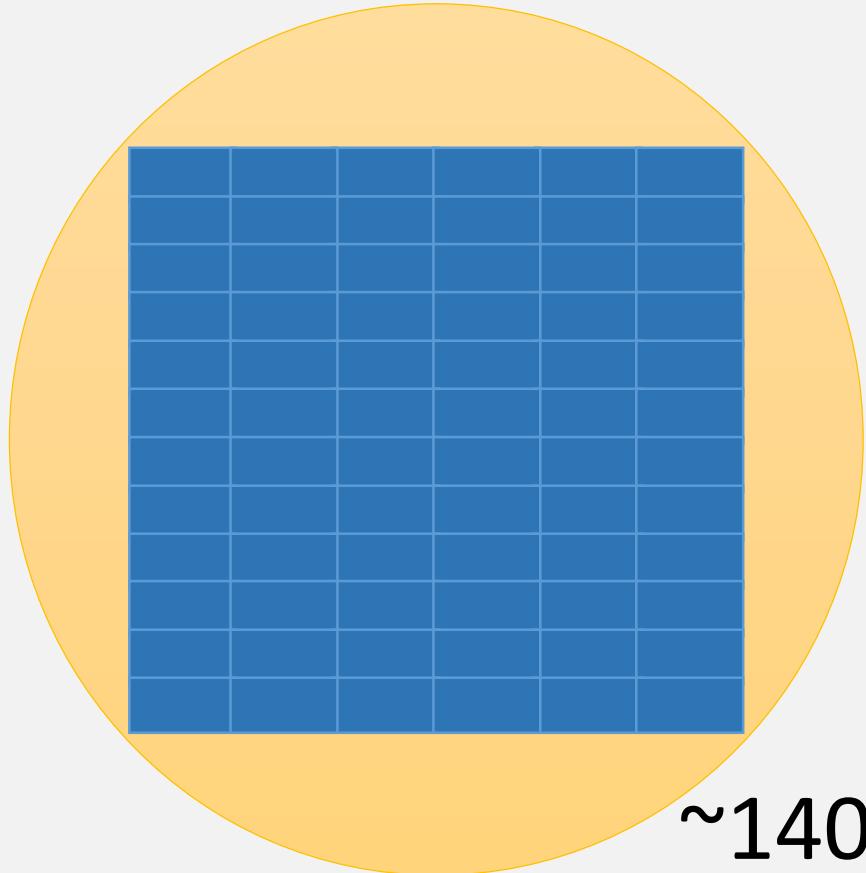

| | | |
|-------------------|------------|-------------------------------|
| TV distortion : | 0.075% | -> linearity < 4μm/5mm |
| Distortion : | 0.25% max. | -> ~0.74% Magnification Error |
| Field curvature : | <1.5μm | -> No loss frame |
| Working distance: | 1.5mm | -> Accept thick emulsion film |

Speed and Coverage of Mosaic Imager

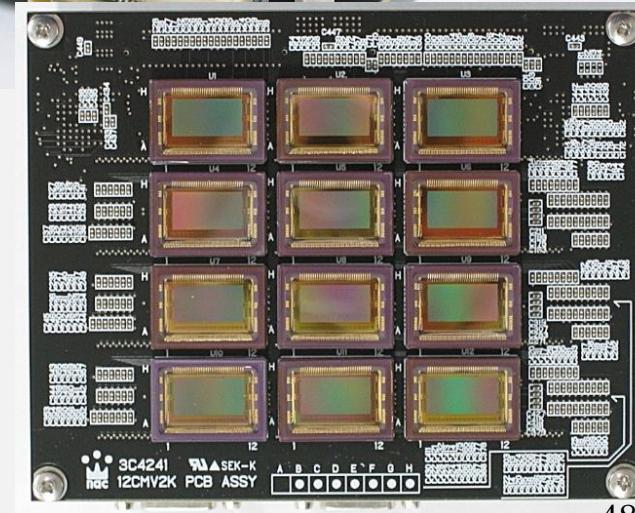

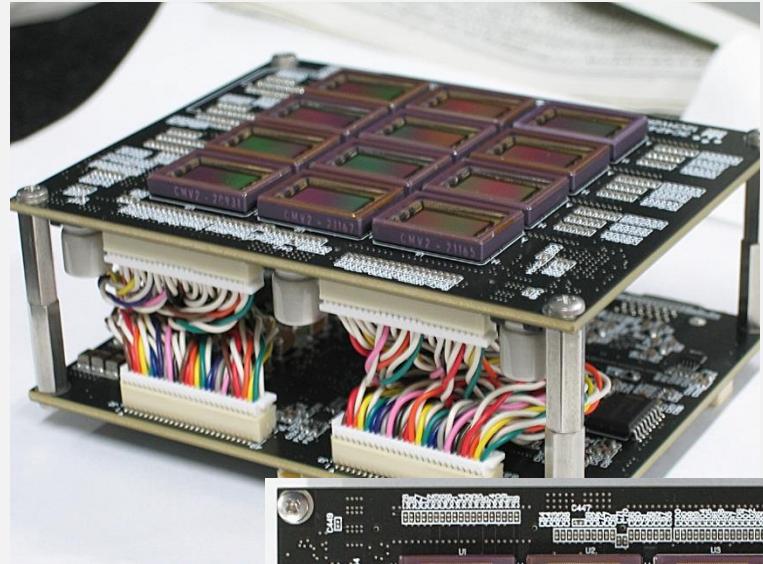

Divide FOV into 72 parts.

Need the sensor of 2M pixel and 340fps.

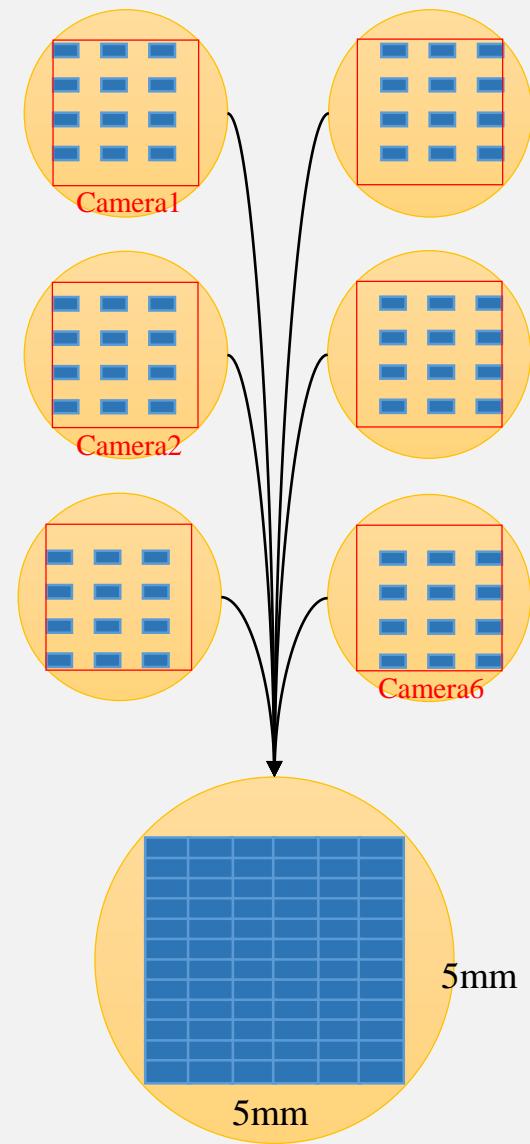

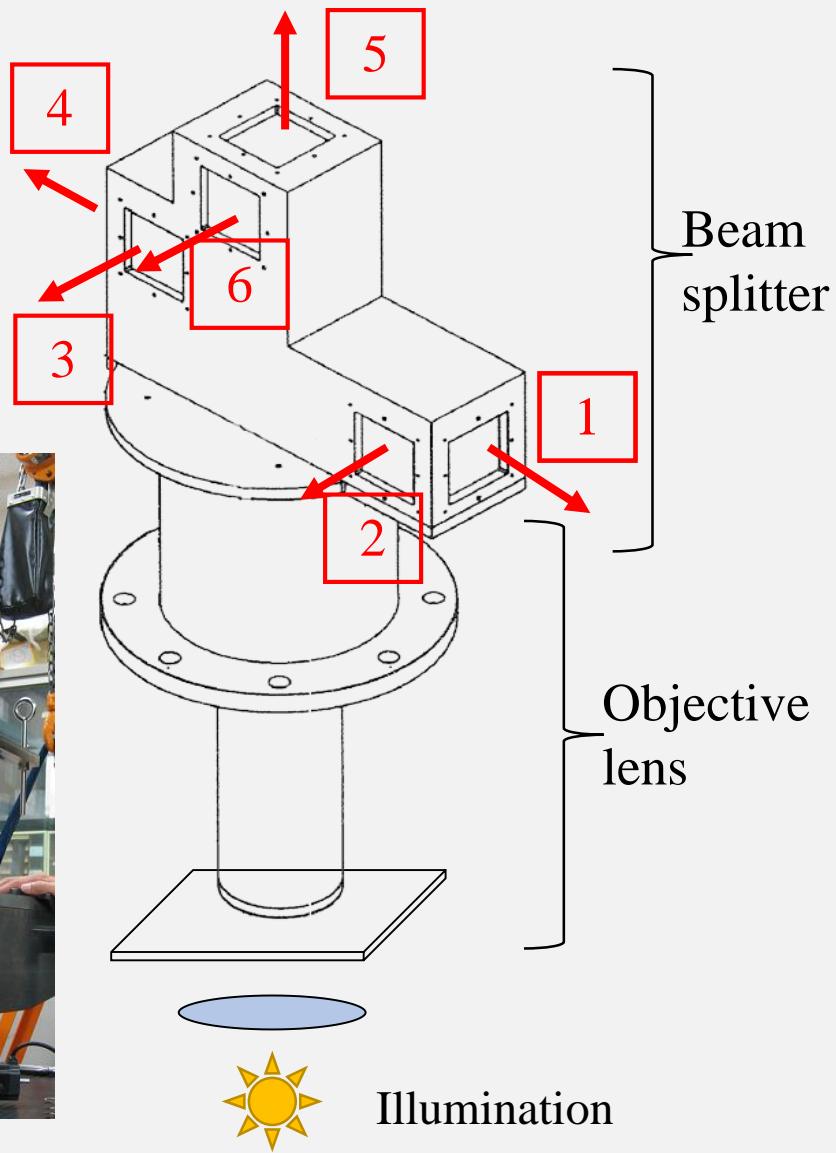

~140M Pixels

Specially developed Mosaic Imager

Mosaic Imager system

How high throughput can be achieved

Throughput = area of FOV \times Repetition rate.

FOV : 600 times larger

To achieve 100 times faster than S-UTS,

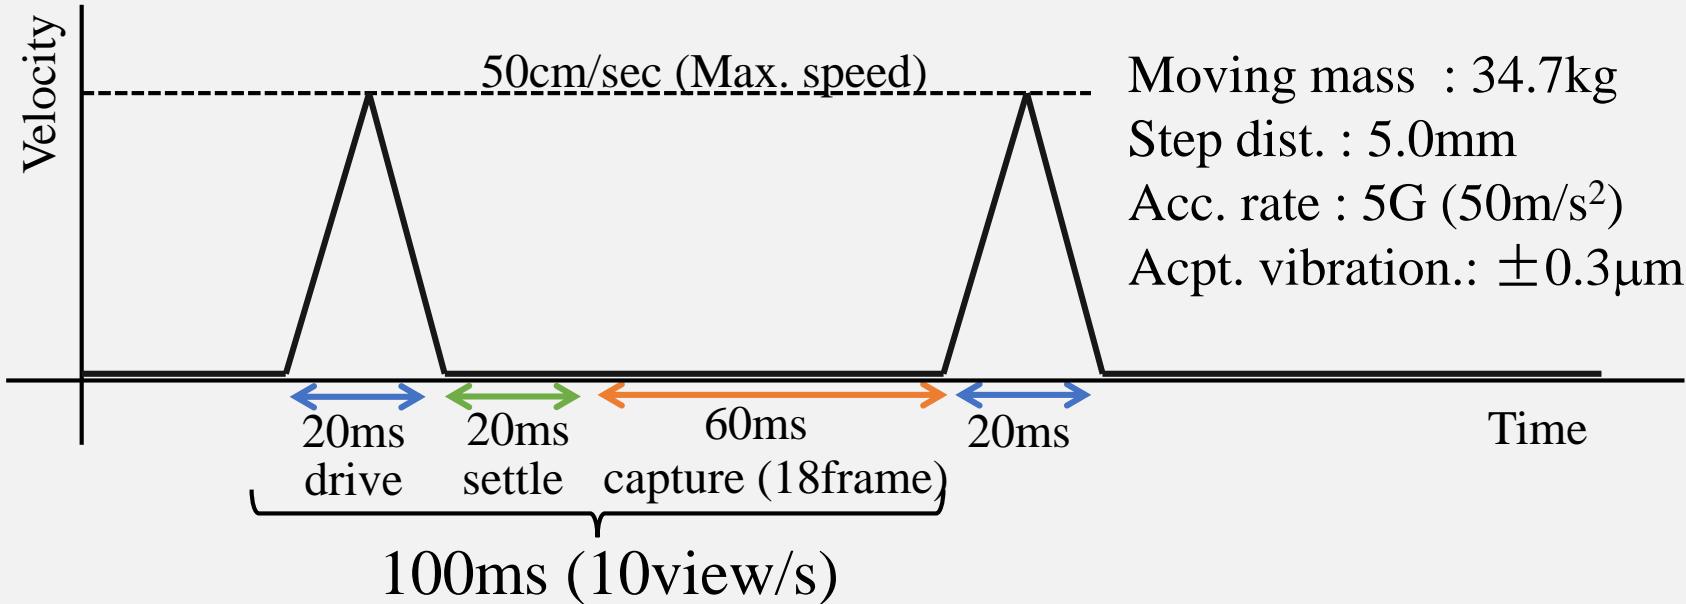

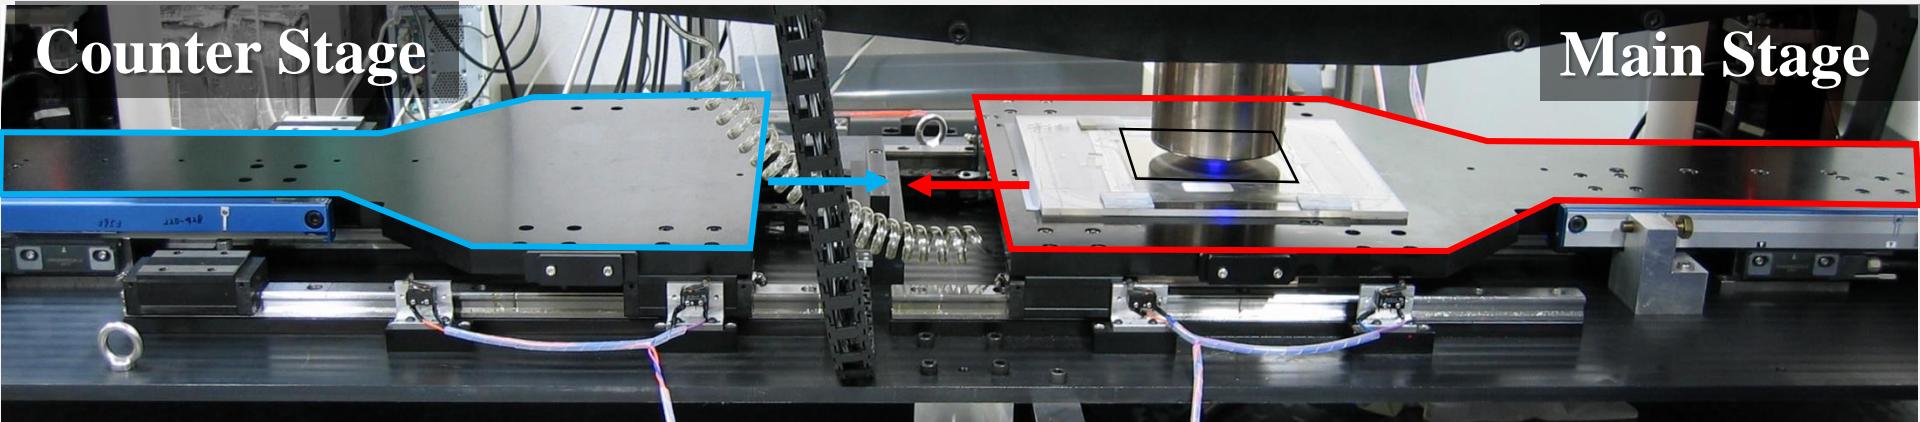

Repetition rate should be >10view/s (1/5 of SUTS)

It takes 60ms to take images at least.

- HTS takes advantage of Stop & Go in image capturing.
- Stopping accuracy should be $0.3\mu\text{m}$.
- The key is how to stop quickly and precisely.

High precision and speed stage

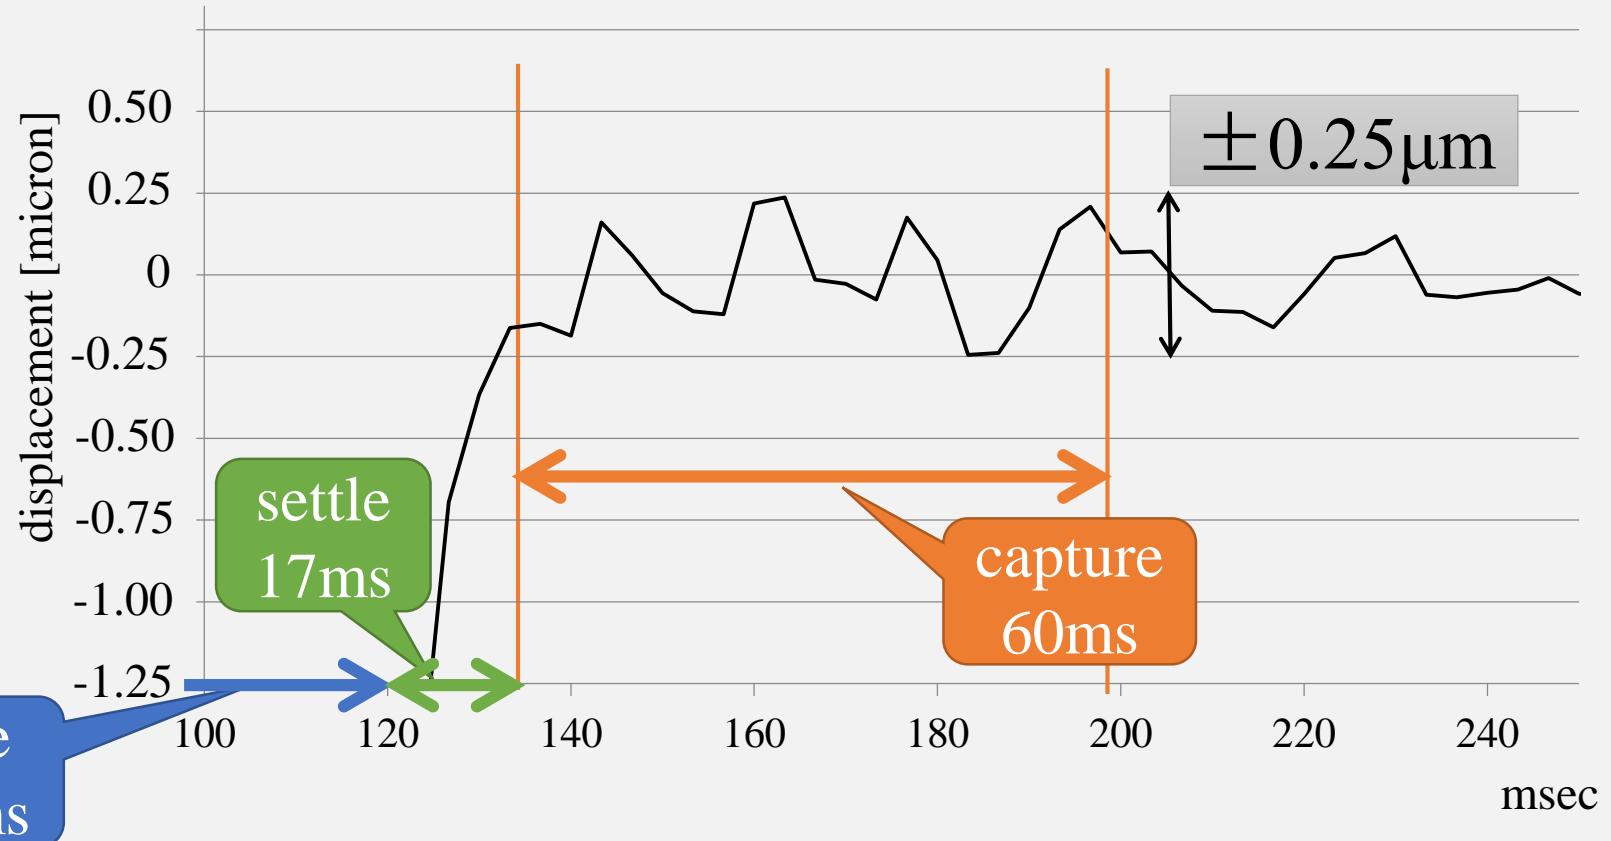

Design value

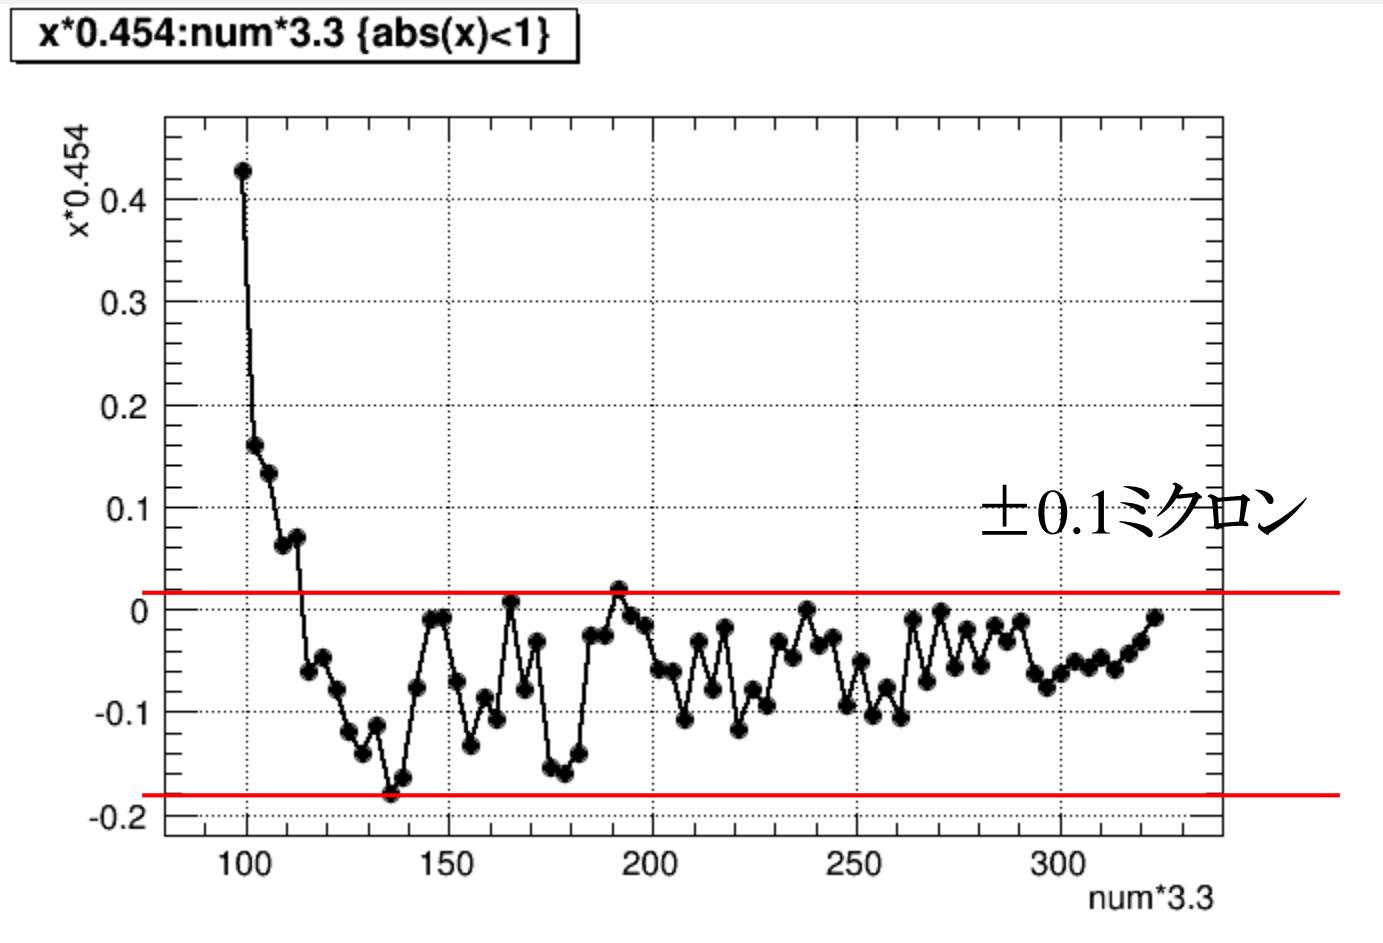

Reaction force is canceled by counter stage

Evaluation of stage settling time

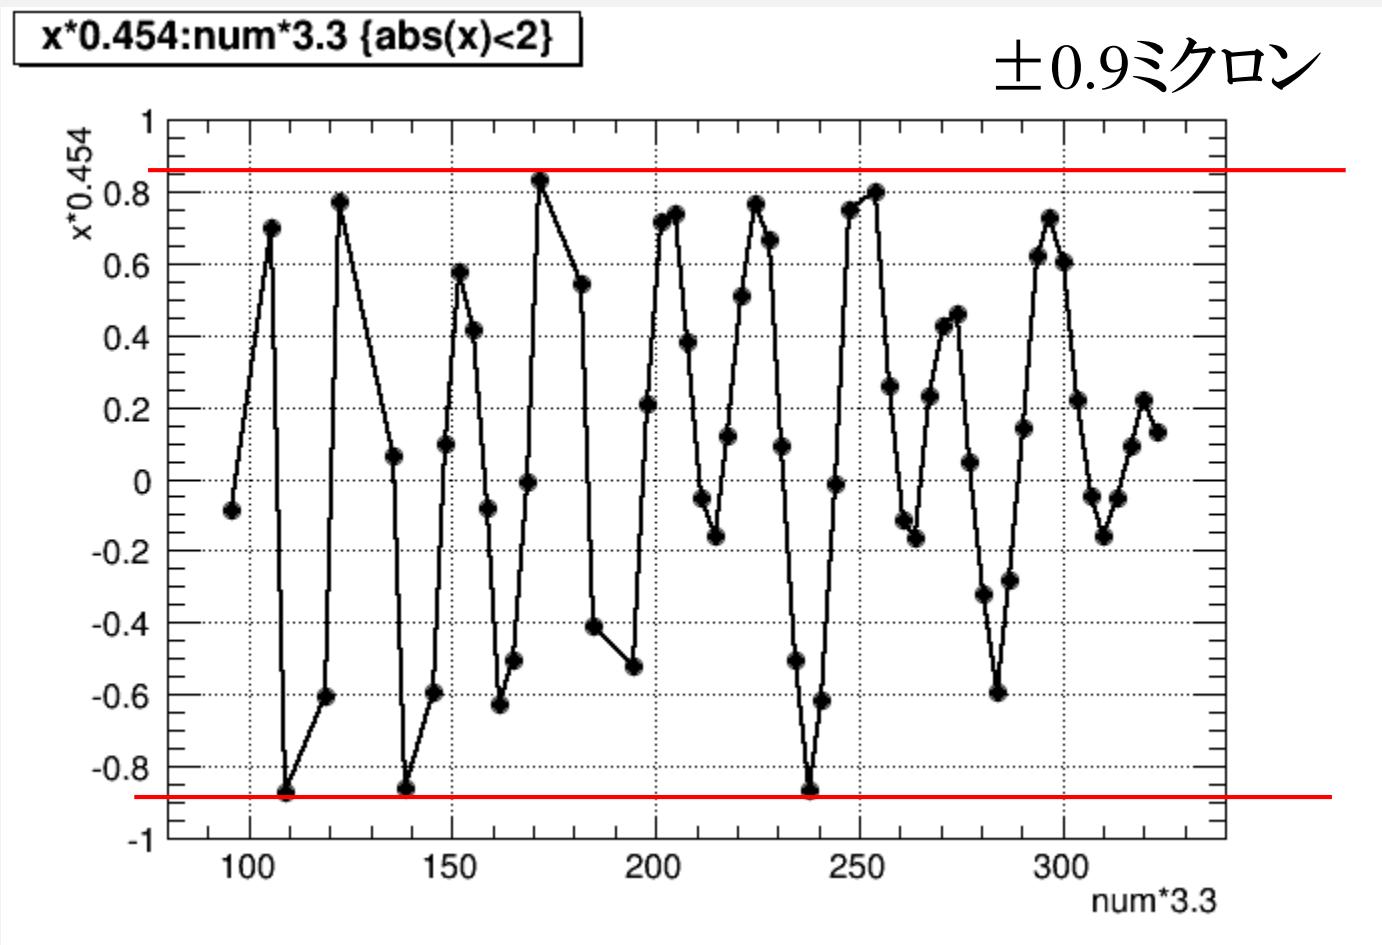

By optimizing the acceleration, 5view/sec was achieved.
The displacement has been measured by using main optics.

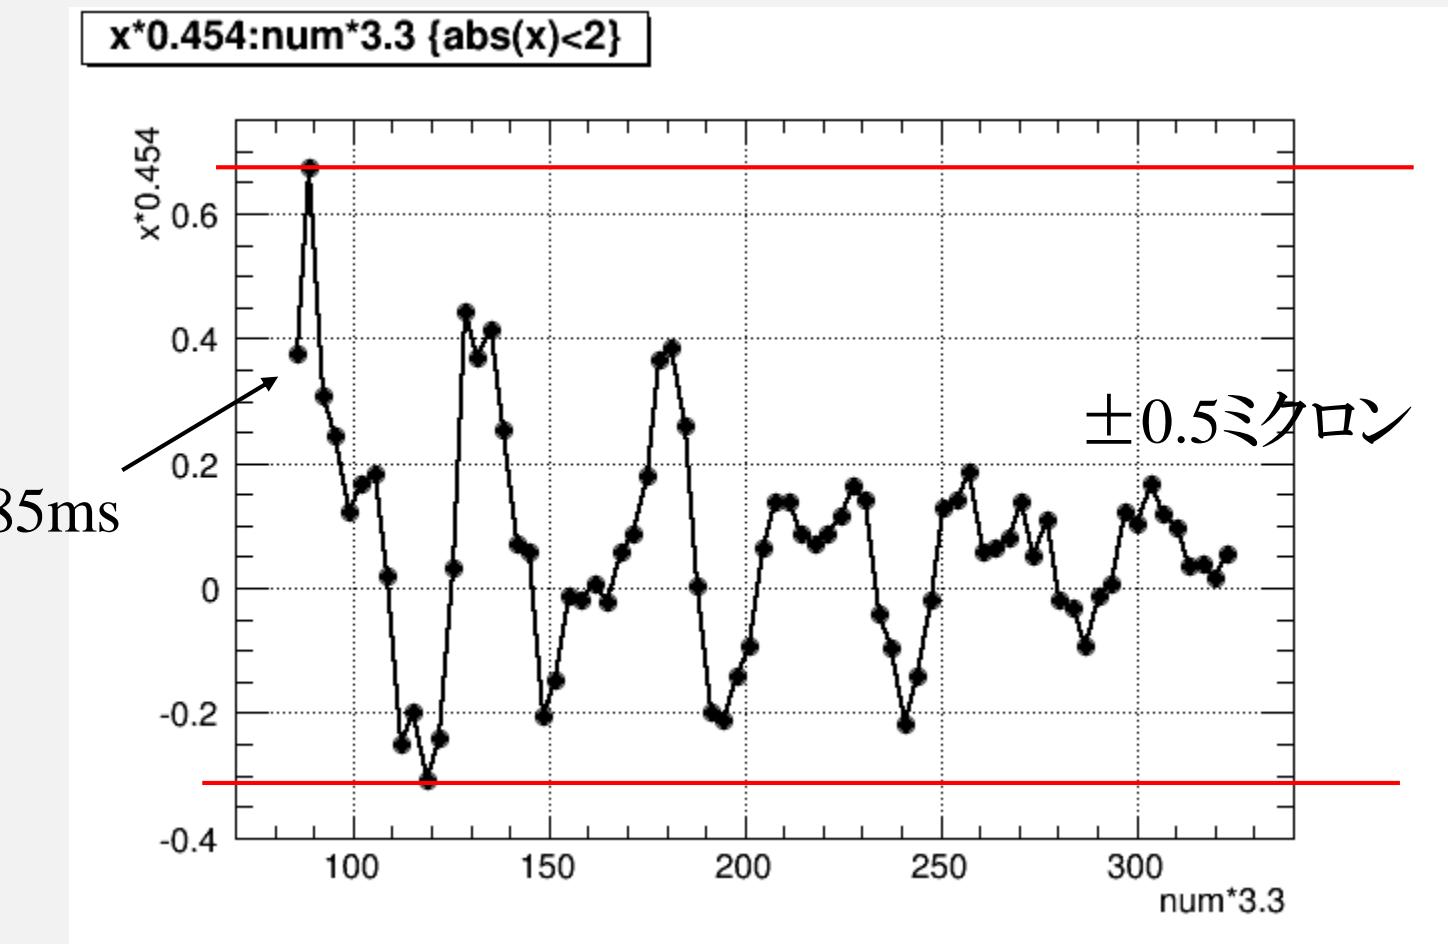

0.4G Acceleration and Stop : 115ms

0.4G Acceleration and Stop without Counter Stage

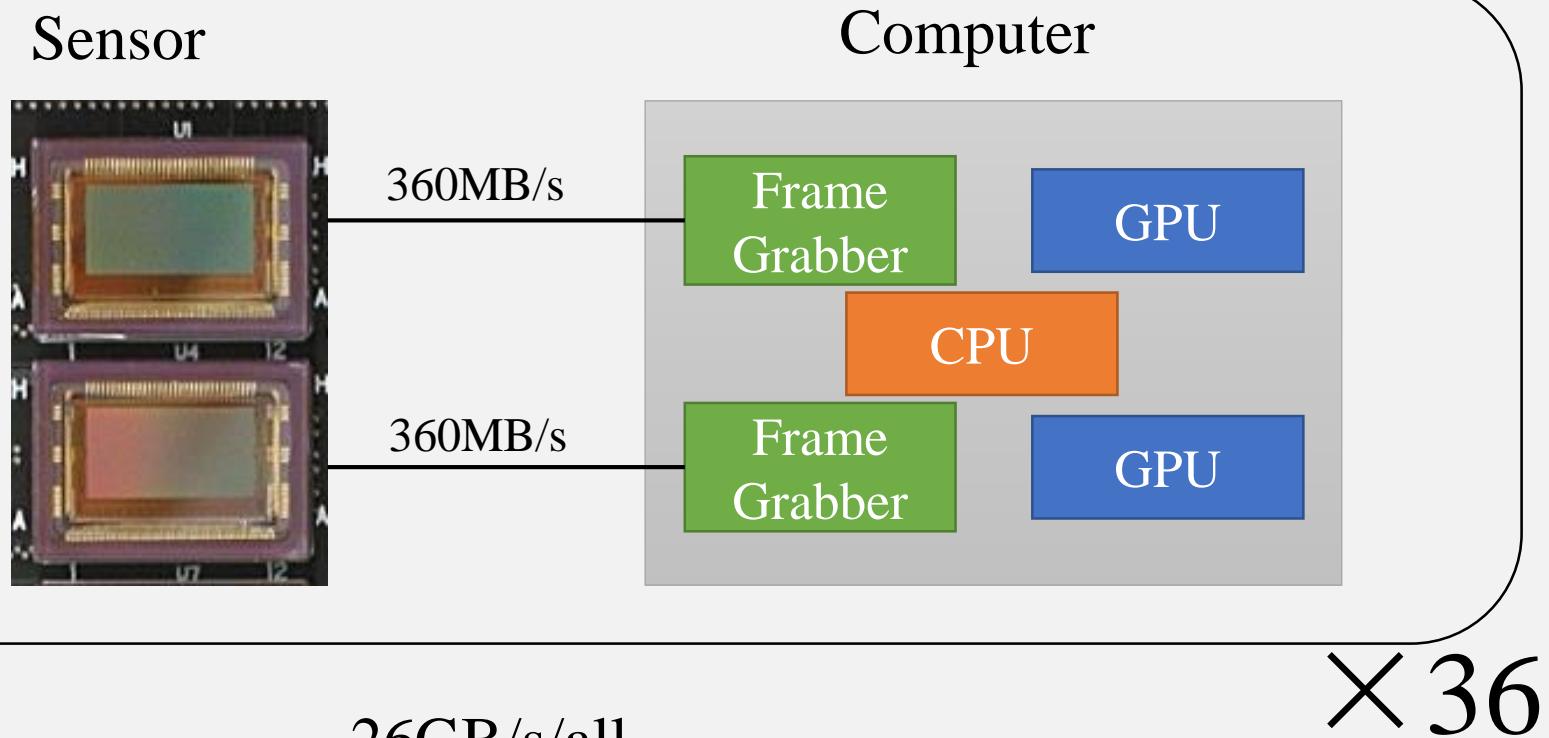

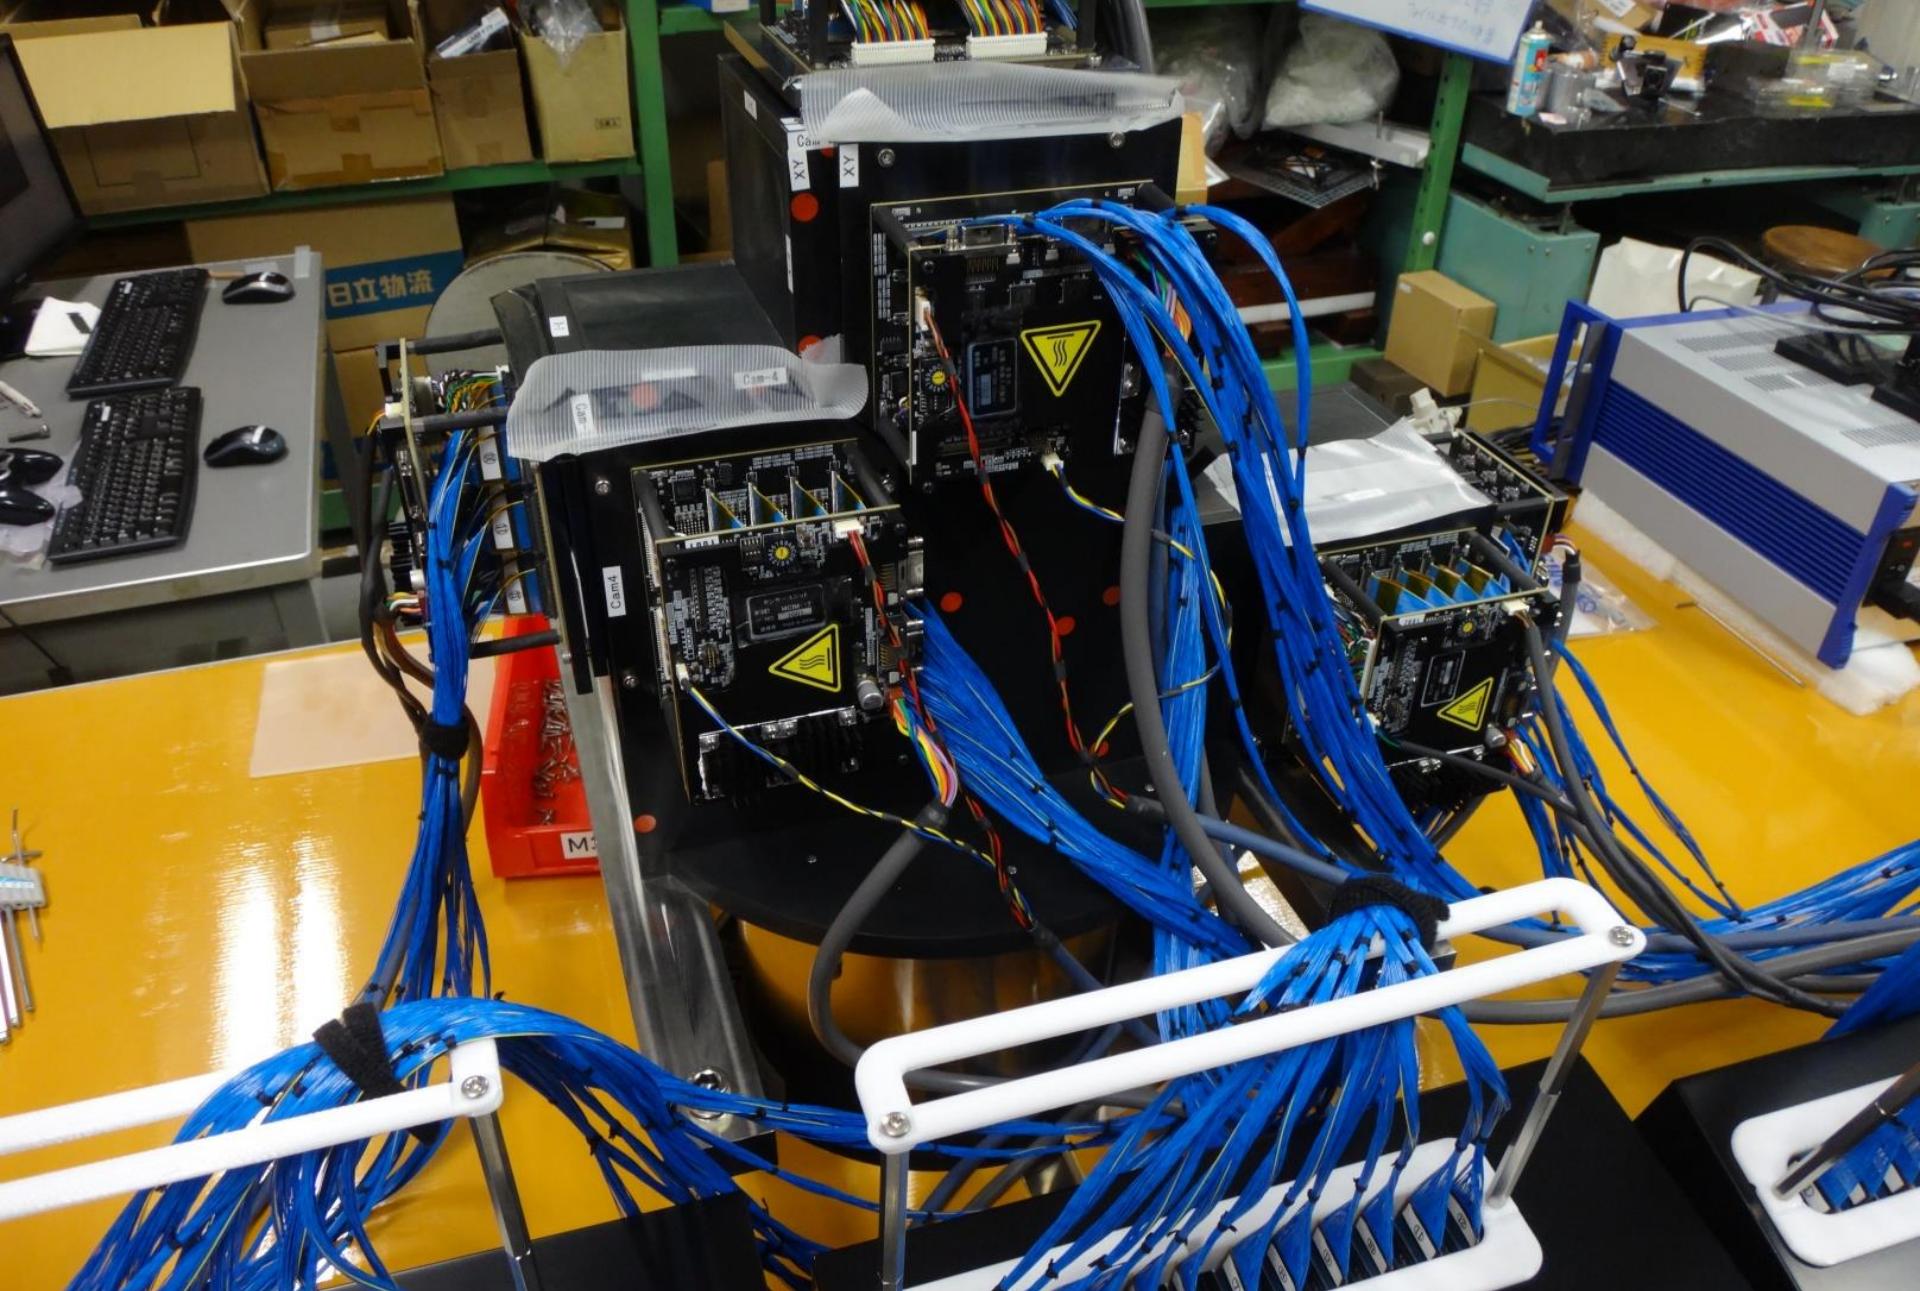

1.0G Acceleration and Stop (X-axis) : 85ms

改善した。

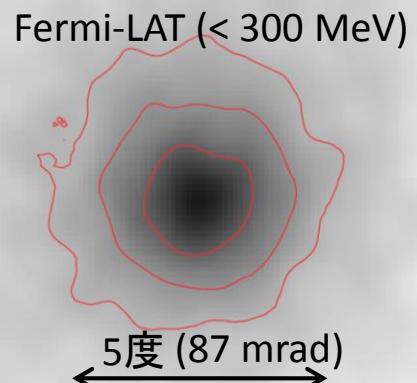

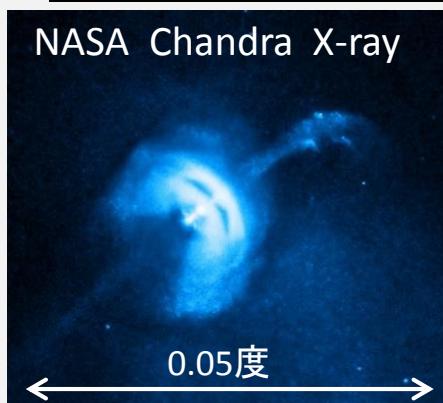

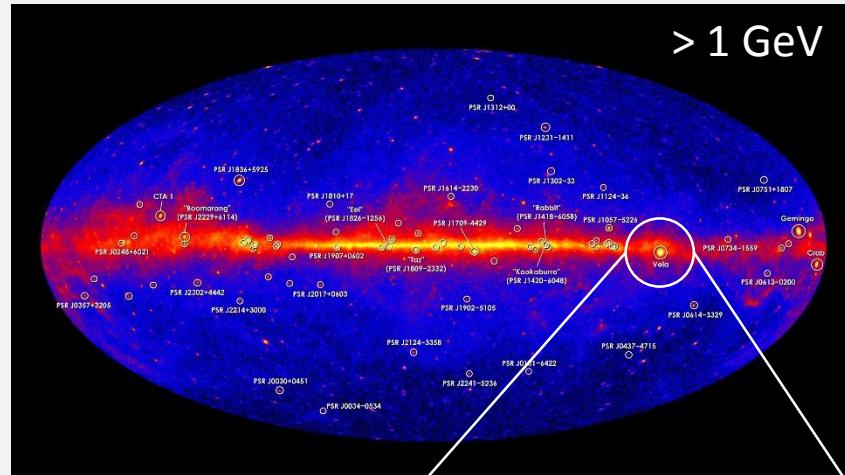

※複数回の測定で
さらに高精度化が可能。

Commissioning

2015 Australia Flight

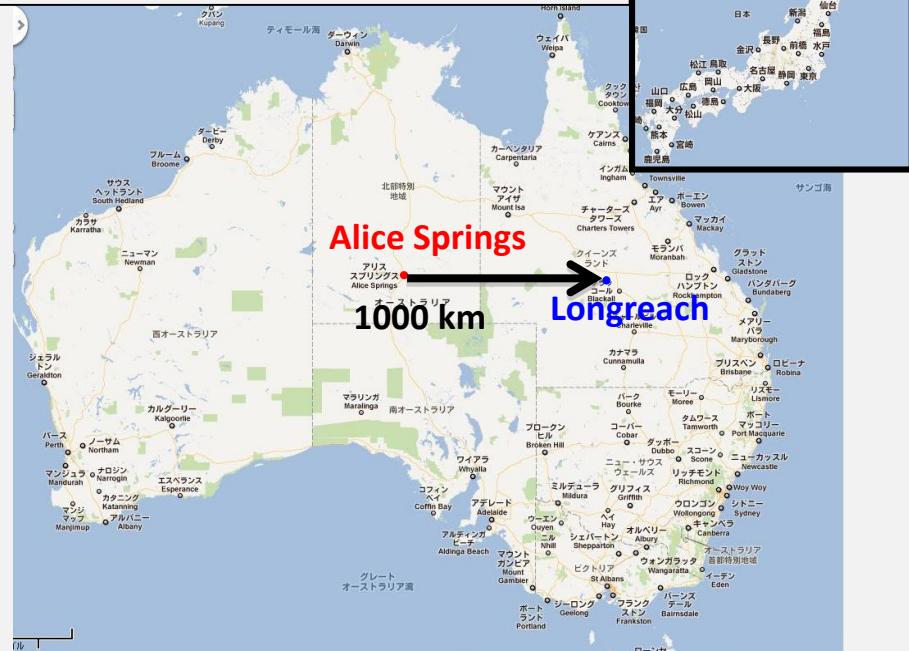

Aim

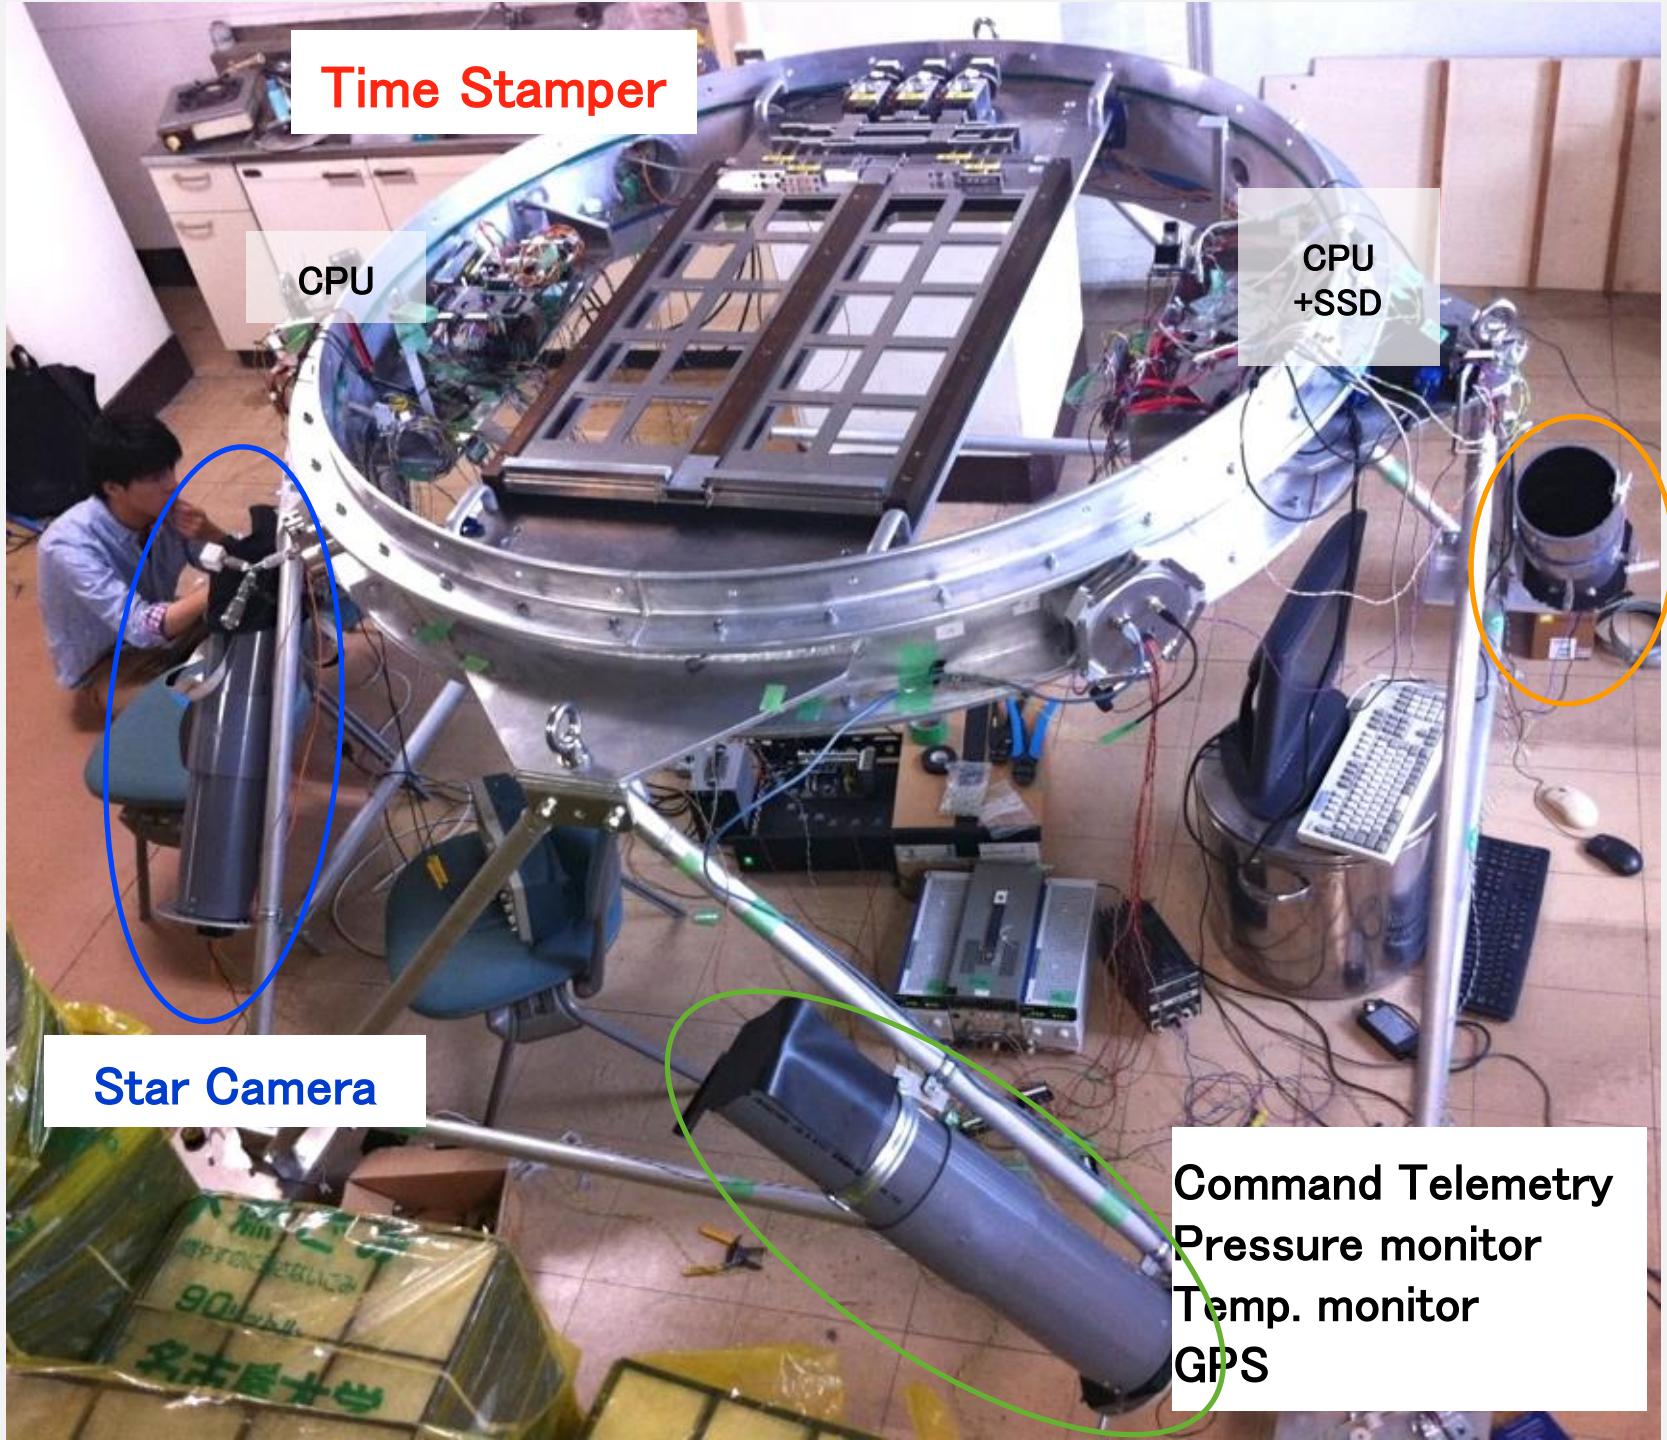

Prove the angular resolution by observing Vela Pulsar 0.5°
(≈ 10 mrad) @100–300 MeV

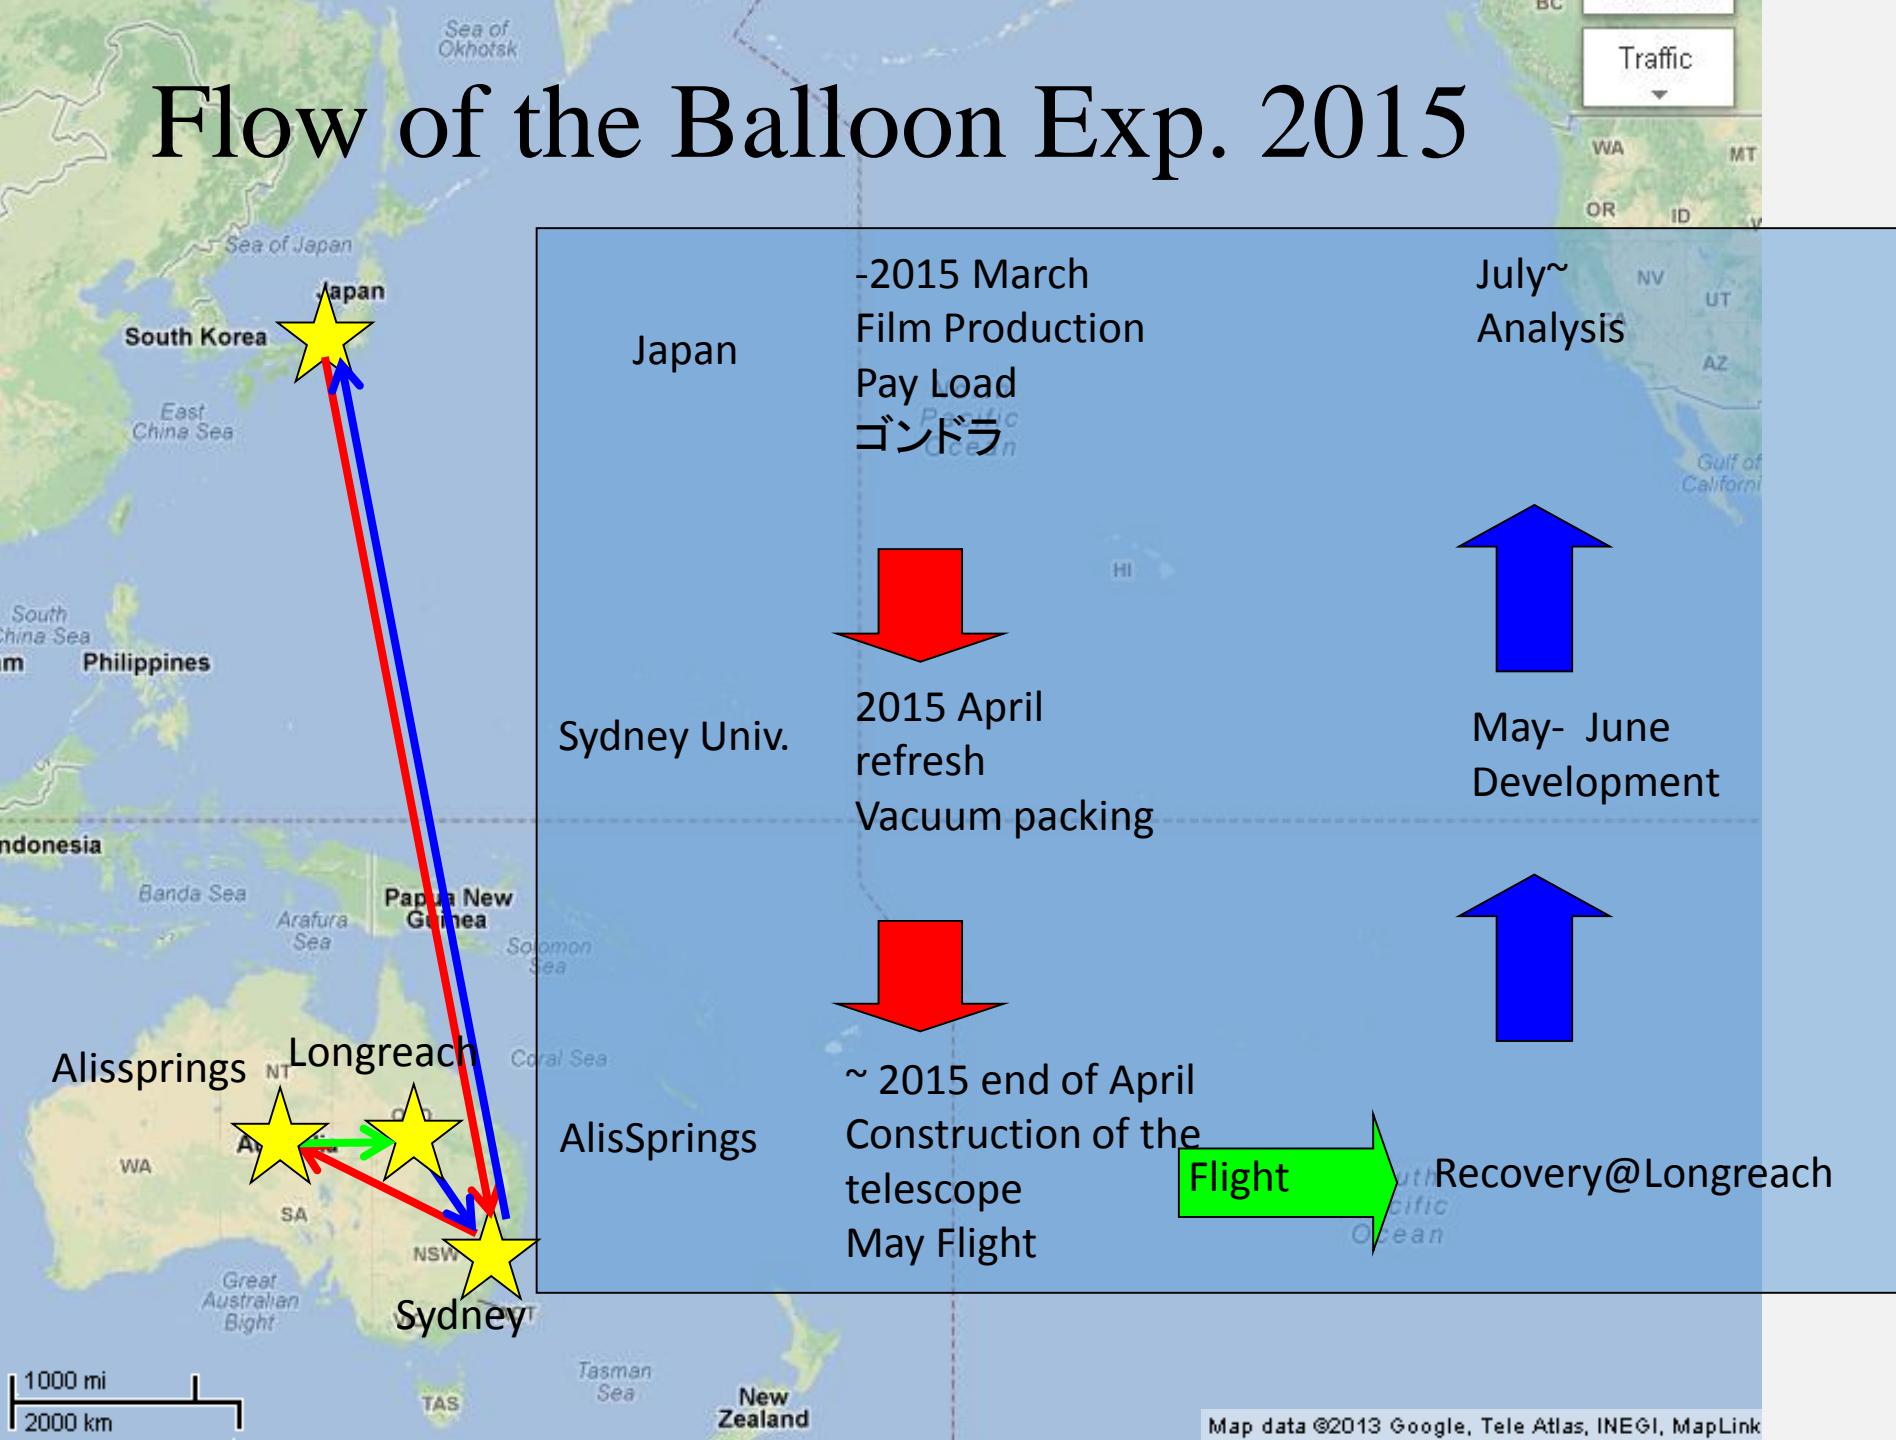

Vela Pulsar ($Flux \sim 1 \times 10^{-5} \text{ cm}^{-2}\text{s}^{-1}$ @100MeV–10GeV)

Flight ~ 1 day
Vela Observation ~ 6.5 hour

Flow of the Balloon Exp. 2015

1000 mi
2000 km

Summary and Prospect

- More Scanning Power is required.
- We are developing HTS which is 100 times faster.
- The efficiency and angle resolution are reasonably good (at the same level as the previous system).
- Commissioning of HTS will be started with GRAINE project.
