[arXiv:1411.4335 [astro-ph.CO]]

Sakata Memorial KMI Workshop on “Origin of Mass and Strong Coupling Gauge Theories” (SCGT15)

Sakata-Hirata Hall, Nagoya University, Nagoya, Japan

5th March, 2015

Presenter: Kazuharu Bamba (*LGSPC, Ochanomizu University*)

I. Introduction

- **Galactic magnetic fields**

$$\sim \mu\text{G}$$

[Sofue *et al.*, Annu. Rev. Astron. Astrophys. 24, 459 (1986)]

- **Magnetic fields in clusters of galaxies**

$$0.1 - 10\mu\text{G}$$

$$10\text{kpc} - \underline{1\text{Mpc}}$$

[Clarke *et al.*, Astrophys. J. 547, L111 (2001)]

- * Recent reviews (examples)

[Kandus *et al.*, Phys. Rep. 505, 1 (2011)] [Yamazaki *et al.*, Phys. Rep. 517, 141 (2012)]

[Maleknejad *et al.*, Phys. Rep. (2013)]

[Durrer and Neronov, Astron. Astrophys. Rev. 21, 62 (2013)]

Origin of cosmic magnetic fields

1. Astrophysical process: **Plasma instability**

[Biermann and Schlüter, Phys. Rev. 82, 863(1951)]

[Weibel, Phys. Rev. Lett. 2, 83 (1959)]

[Hanayama *et al.*, Astrophys. J. 633, 941 (2005)]

[Fujita and Kato, Mon. Not. Roy. Astron. Soc. 364, 247 (2005)]

2. Cosmological processes:

- **Electroweak/Quark-hadron phase transitions**

[Baym, Bödeker and McLerran, Phys. Rev. D 53, 662 (1996)]

[Quashnock, Loeb and Spergel, Astrophys. J. 344, L49 (1989)]

- **Density perturbations** [Ichiki *et al.*, Science 311, 827 (2006)]
[Kobayashi, *et al.*, Phys. Rev. D 75, 103501 (2007)]

Origin of cosmic magnetic fields (2)

- Coherence scale
- Strength

→ It is difficult to obtain the results to explain the observations.

→ The most natural origin of large-scale magnetic fields:
Electromagnetic quantum fluctuations generated at the inflationary stage

Inflationary cosmology

[Sato, Mon. Not. Roy. Astron. Soc. 195, 467 (1981)]

[Guth, Phys. Rev. D 23, 347 (1981)]

[Starobinsky, Phys. Lett. B 91, 99 (1980)]

[Linde, Phys. Lett. B 108, 389 (1982)]

[Albrecht and Steinhardt, Phys. Rev. Lett. 48, 1220 (1982)]

Inflation:

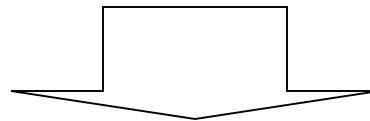

**Exponential cosmic acceleration in the
early universe**

1. Homogeneity, Isotropy, and Flatness
2. Primordial density perturbations

Obstacle

- Friedmann-Lemaître-Robertson-Walker (FLRW) metric is conformally flat.
- The Maxwell theory is conformally invariant.

The conformal invariance has to be broken at the inflationary stage.

Breaking mechanisms

1. Coupling of a scalar field to electromagnetic fields

[Ratra, *Astrophys. J.* 391, L1 (1992)]

[KB and Yokoyama, *Phys. Rev. D* 69, 043507 (2004); 70, 083508 (2004)]

2. Non-minimal coupling of electromagnetic fields to gravity

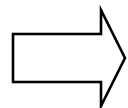

[Turner and Widrow, *Phys. Rev. D* 37, 2743 (1988)]

[KB and Sasaki, *JCAP* 0702, 030 (2007)]

3. Trace anomaly

[Dolgov, *Phys. Rev. D* 48, 2499 (1993)]

Motivation and Purpose (1)

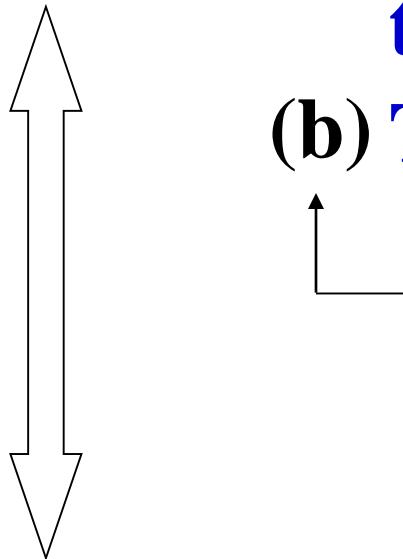

By comparing the theoretical predictions of a toy model with observations, we obtain phenomenological implications on moduli inflation.

Motivation and Purpose (2)

Model (a) **Coupling of the electromagnetic field to a scalar field**

(b) **That to a pseudo scalar field (inflaton)**

Both couplings: Novel point

* In the past works: Only (b)

E.g.: [Barnaby and Peloso, Phys. Rev. Lett. 106, 181301 (2011)]

[Barnaby, Namba and Peloso, JCAP 1104, 009 (2011)]

Observables

(i) **Large-scale magnetic fields**

(ii) **Non-Gaussianity**

(iii) **Tensor-to-scalar ratio**

II. Model

$$\mathcal{L} = \underbrace{\frac{M_P^2}{2} R - \frac{1}{4} X F_{\mu\nu} F^{\mu\nu}}_{\text{Gravity term}} - \underbrace{\frac{1}{4} g_{\text{ps}} \frac{Y}{M} F_{\mu\nu} \tilde{F}^{\mu\nu}}_{-\frac{1}{2} g^{\mu\nu} \partial_\mu \Phi \partial_\nu \Phi - U(\Phi) - \frac{1}{2} g^{\mu\nu} \partial_\mu Y \partial_\nu Y - V(Y)} -$$

Breaking of the conformal invariance

$M_P \simeq 2.4 \times 10^{18}$ GeV : Reduced Planck mass

R : Scalar curvature

Model (2)

$$\mathcal{L} = \frac{M_P^2}{2} R - \frac{1}{4} X F_{\mu\nu} F^{\mu\nu} - \frac{1}{4} g_{ps} \frac{Y}{M} F_{\mu\nu} \tilde{F}^{\mu\nu}$$

$$- \frac{1}{2} g^{\mu\nu} \partial_\mu \Phi \partial_\nu \Phi - U(\Phi) - \frac{1}{2} g^{\mu\nu} \partial_\mu Y \partial_\nu Y - V(Y)$$

Coupling of a scalar field Φ to the electromagnetic field

$X \equiv \exp(-\lambda \Phi / M_P)$, λ : Normalization constant

$U(\Phi)$: Potential of Φ

$F_{\mu\nu} = \nabla_\mu F_\nu - \nabla_\nu F_\mu$, F_μ : $U(1)_Y$ gauge field

Model (3)

$$\mathcal{L} = \frac{M_P^2}{2}R - \frac{1}{4}XF_{\mu\nu}F^{\mu\nu} - \underline{\frac{1}{4}g_{ps}\frac{Y}{M}F_{\mu\nu}\tilde{F}^{\mu\nu}}$$

$$-\frac{1}{2}g^{\mu\nu}\partial_\mu\Phi\partial_\nu\Phi - U(\Phi) - \frac{1}{2}g^{\mu\nu}\partial_\mu Y\partial_\nu Y - \underline{V(Y)}$$

Coupling of a pseudo scalar field Y (inflaton) to the electromagnetic field

g_{ps} : Dimensionless constant

$\tilde{F}_{\mu\nu}$: Dual tensor of $F_{\mu\nu}$

M : Mass scale

$V(Y) \approx \bar{V} - \frac{1}{2}m^2Y^2$: Potential of Y

\bar{V} : Normalization constant

(Feature of moduli inflation)

m : Mass of Y

Equations of motion (EoM) (1)

Flat FLRW space-time

$$ds^2 = -dt^2 + a^2(t)dx^2 \quad a(t) : \text{Scale factor}$$

EoM for Φ

$$\ddot{\Phi} + 3H\dot{\Phi} + \frac{dU(\Phi)}{d\Phi} = 0$$

$H = \dot{a}/a$: Hubble parameter
 $\cdot = \partial/\partial t$

EoM for Y (inflaton)

$$\ddot{Y} + 3H\dot{Y} + \frac{dV(Y)}{dY} = 0$$

Equations of motion (EoM) (1)

EoM for the $U(1)_Y$ gauge field

$$* \quad F_0 = \partial_j F^j(t, \mathbf{x}) = 0 : \text{Coulomb gauge}$$

$$\ddot{F}_i(t, \mathbf{x}) + \left(H + \frac{\dot{X}}{X} \right) \dot{F}_i(t, \mathbf{x}) - \frac{1}{a^2} \partial_j \partial_j F_i(t, \mathbf{x}) - \frac{g_{\text{ps}}}{M} \frac{1}{aX} \dot{Y} \epsilon^{ijk} \partial_j F_k(t, \mathbf{x}) = 0$$

Breaking of the conformal invariance

ϵ_{ijk} : Totally antisymmetric tensor
 $(\epsilon_{123} = +1)$

Slow-roll inflation

$$a(t) = a_k \exp [H_{\text{inf}} (t - t_k)] \quad \longleftarrow \quad \underline{\dot{Y}^2/2 \ll V(Y)}$$

$$Y = Y_k \exp \left\{ \frac{3}{2} \left[-1 \pm \sqrt{1 + \left(\frac{2m}{3H_{\text{inf}}} \right)^2} \right] H_{\text{inf}} (t - t_k) \right\}$$

$$k/(a_k H_{\text{inf}}) = 1$$

H_{inf} : Hubble parameter at the inflationary stage

a_k : Value of the scale factor at $t = t_k$

t_k : Time when a comoving wavelength $2\pi/k$ of the $U(1)_Y$ gauge field first crosses the horizon during inflation

Quantization of $U(1)_Y$ gauge field

Canonical momenta $\pi_0 = 0 , \quad \pi_i = Xa\dot{F}_i(t, \mathbf{x})$

Canonical commutation relation \mathbf{k} : Comoving wavenumber

$$[F_i(t, \mathbf{x}), \pi_j(t, \mathbf{y})] = i \int \frac{d^3k}{(2\pi)^{3/2}} e^{i\mathbf{k}\cdot(\mathbf{x}-\mathbf{y})} [\delta_{ij} - (k_i k_j / k^2)] \quad k = |\mathbf{k}|$$

$$F_i(t, \mathbf{x}) = \int \frac{d^3k}{(2\pi)^{3/2}} \left[\hat{b}(\mathbf{k}) \underline{F_i(t, \mathbf{k})} e^{i\mathbf{k}\cdot\mathbf{x}} + \hat{b}^\dagger(\mathbf{k}) \underline{F_i^*(t, \mathbf{k})} e^{-i\mathbf{k}\cdot\mathbf{x}} \right]$$

$$[\hat{b}(\mathbf{k}), \hat{b}^\dagger(\mathbf{k}')] = \delta^3(\mathbf{k} - \mathbf{k}'), \quad [\hat{b}(\mathbf{k}), \hat{b}(\mathbf{k}')] = [\hat{b}^\dagger(\mathbf{k}), \hat{b}^\dagger(\mathbf{k}')] = 0$$

Normalization condition $\hat{b}(\mathbf{k}), \quad \hat{b}^\dagger(\mathbf{k})$: Annihilation and creation operators

$$F_i(k, t) \dot{F}_j^*(k, t) - \dot{F}_j(k, t) F_i^*(k, t) = \frac{i}{Xa} [\delta_{ij} - (k_i k_j / k^2)]$$

Circular polarization of $U(1)_Y$ gauge field

- x^3 axis to lie along the spatial momentum k direction

→ Transverse directions x^I ($I = 1, 2$)

- Circular polarization: $F_{\pm}(k, t) \equiv F_1(k, t) \pm iF_2(k, t)$

$$\ddot{F}_{\pm}(k, t) + \left(H_{\text{inf}} + \frac{\dot{X}}{X} \right) \dot{F}_{\pm}(k, t) + \left[1 \pm \frac{g_{\text{ps}}}{M} \frac{\dot{Y}}{X} \left(\frac{k}{a} \right)^{-1} \right] \left(\frac{k}{a} \right)^2 F_{\pm}(k, t) = 0$$

$$C_+(k, t) \equiv \frac{F_+(k, t)}{F_+(k, t_k)} : \text{Normalized amplitude}$$

Evolution of $C_+(k, t)$ (1)

$C_+(k, t)$

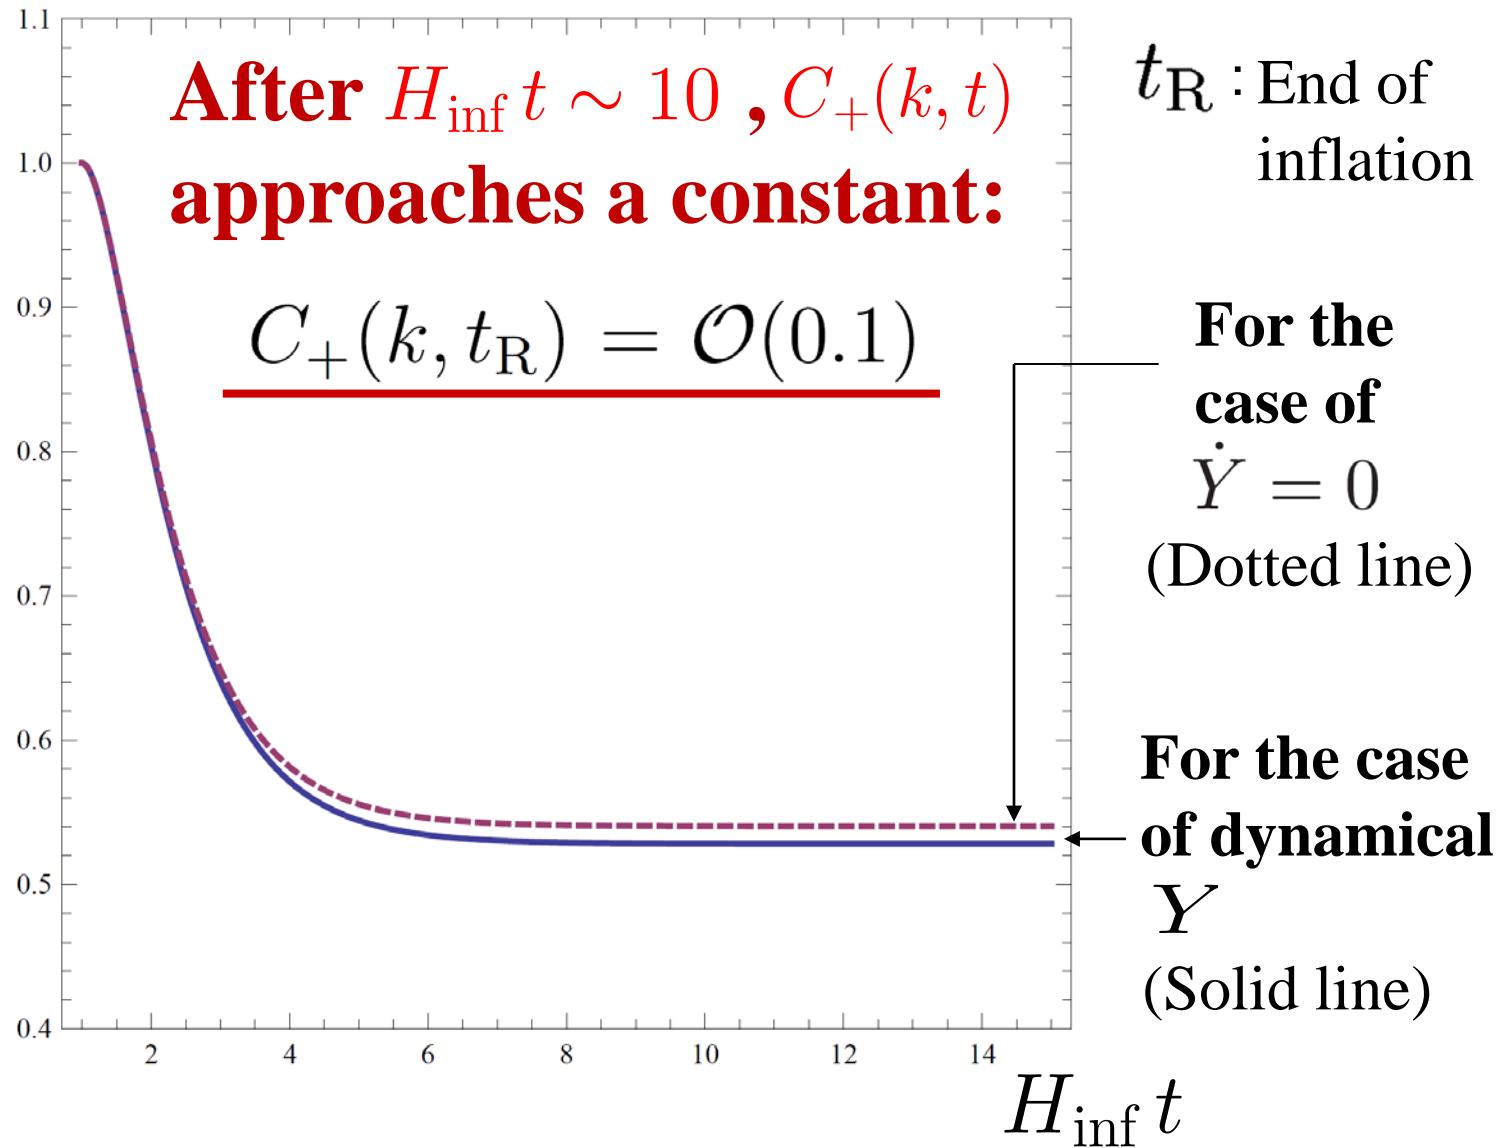

Fig. 1

Evolution of $C_+(k, t)$ (2)

Values of parameters for Fig.1

$$X(t_k) \equiv \exp(\chi_k), \quad \chi_k = -0.940$$

$$H_{\text{inf}} = 1.0 \times 10^{10} \text{GeV}, \quad m = 2.44 \times 10^9 \text{GeV}$$

$$Y_k = 7.70 \times 10^{-2} M_P, \quad M = 1.0 \times 10^{-1} M_P$$

$$\bar{V} = 5.07 \times 10^{-17} M_P^4, \quad g_{\text{ps}} = 1.0$$

Evolution of $C_+(k, t)$ (3)

- **COBE normalization**

(Amplitude of power spectrum of the curvature perturbations)

$$\Delta_{\mathcal{R}}^2(k) = 2.4 \times 10^{-9} \quad \text{at} \quad k = 0.002 \text{Mpc}^{-1}$$

- **Planck result**

(Spectral index of power spectrum of the curvature perturbations)

$$n_s = 0.9603 \pm 0.0073 \text{ (68% CL)} \quad \text{at} \quad k = 0.05 \text{Mpc}^{-1}$$

[Ade *et al.* [Planck Collaboration], Astron. Astrophys. 571, A22 (2014)]

$$n_s \simeq 1 - 6\epsilon_V + 2\eta_V$$

Slow-roll parameters:

$$\epsilon_V \equiv \frac{M_P^2}{2} \left(\frac{V'(Y)}{V(Y)} \right)^2, \quad \eta_V \equiv M_P^2 \frac{V''(Y)}{V(Y)}$$

- $\bar{V} = 3H_{\inf}^2 M_P^2$: **Friedmann equation**

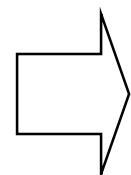

III. Current strength of the magnetic fields

Proper magnetic field

$$B_Y^{\text{proper}}(t, \mathbf{x}) = \frac{1}{a^2} B_{Yi}(t, \mathbf{x}) = \frac{1}{a^2} \epsilon_{ijk} \partial_j F_k(t, \mathbf{x})$$

- **Instantaneous reheating at $t = t_R$**
- **After reheating, $\sigma_c \gg H$.**

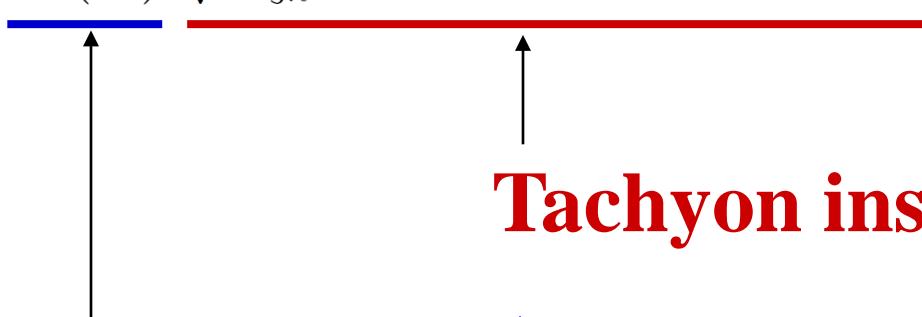

σ_c : Cosmic conductivity

$$B^{\text{proper}} \propto a^{-2}$$

Current strength of the magnetic fields (2)

$$\rho_B(L, t) \simeq \frac{1}{8\pi^2} \frac{1}{X(t_k)} \frac{1}{\sqrt{2\xi_k}} \exp \left[2 \left(\pi \xi_k - 2\sqrt{2\xi_k} \right) \right] \left(\frac{k}{a} \right)^4 |C_+(k, t_R)|^2$$

Tachyon instability

$$\propto (X(t_k))^{-1}$$

$$\xi \equiv \frac{1}{2} \frac{g_{\text{ps}}}{M} \frac{1}{X} \frac{\dot{Y}}{H_{\text{inf}}} , \quad \xi_k \equiv \xi(t = t_k)$$

$L = 2\pi/k$: Comoving scale

- * $X(t_R) = 1$: After inflation, the Maxwell theory is recovered.

Current strength of the magnetic fields (3)

	$B(H_0^{-1}, t_0)$ [G]	H_{inf} [GeV]	m [GeV]	Y_k/M_P	$C_+(k, t_R)$
(a)	7.15×10^{-64}	1.0×10^{11}	2.44×10^{10}	7.70×10^{-2}	0.528
(b)	7.15×10^{-64}	1.0×10^{10}	2.44×10^9	7.70×10^{-2}	0.528
(c)	2.33×10^{-64}	1.0×10^8	1.0×10^7	1.62×10^1	0.172
(d)	2.33×10^{-64}	1.0×10^6	1.0×10^5	1.62×10^1	0.172
(e)	2.85×10^{-64}	1.0×10^4	8.0×10^2	2.23×10^1	0.211
(f)	2.85×10^{-64}	1.0×10^2	8.0	2.23×10^1	0.211

Current strength of magnetic fields on the Hubble horizon scale H_0^{-1} :

t_0 : Present time

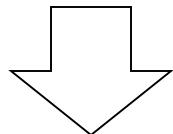

For Fig. 1

$$B(H_0^{-1}, t_0) \sim 10^{-64} \text{ G}$$

IV. Non-Gaussianity of curvature perturbations

- Perturbed Einstein equation

Metric perturbation

= Matter density perturbation

(1) Scalar mode (Curvature perturbation)

→ Temperature perturbation of the cosmic microwave background (CMB) radiation:

$$\frac{\delta T}{T} \simeq 10^{-5}$$

(2) Vector mode

(3) Tensor mode (Primordial gravitational wave)

Non-Gaussianity of curvature perturbations (2)

- We suppose that the $U(1)_Y$ gauge field F_μ couples to another Higgs-like field φ , which develops a vacuum expectation value, through the kinetic term $|D\varphi|^2$.

[Meerburg and Pajer, JCAP 1302, 017 (2013)]

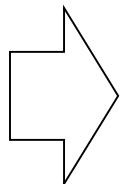

$$D_\mu \equiv \partial_\mu + ig'F_\mu : \text{Covariant derivative for } \varphi$$

$$g' : \text{Gauge coupling}$$

→ The gauge symmetry can spontaneously be broken, so that the gauge field acquires its mass.

Non-Gaussianity of curvature perturbations (3)

- The number of e -folds of inflation could be changed by the perturbations of φ .
- The curvature perturbations can be generated through the perturbations of φ .

The local-type non-Gaussianity in terms of the curvature perturbations is produced.

* δN formalism

[Sasaki and Stewart, Prog. Theor. Phys. 95, 71 (1996)]

[Starobinsky, JETP Lett. 42, 152(1985)]

[Lyth and Rodriguez, Phys. Rev. Lett. 95, 121302 (2005)]

Non-Gaussianity of curvature perturbations (4)

$$\Phi(x) = \Phi_L(x) + \frac{f_{\text{NL}}^{\text{local}}}{\uparrow} (\Phi_L^2(x) - \langle \Phi_L^2(x) \rangle)$$

Quantity showing the non-Gaussianity

[Ade *et al.* [Planck Collaboration], Astron. Astrophys. **571**, A24 (2014)]

$\Phi_L(x)$: Gravitational potential with the Gaussian statistical property

Non-Gaussianity of curvature perturbations (5)

$$f_{\text{NL}}^{\text{local}} \approx 1.0 \times 10^{14} \frac{g'^4}{\xi^6} \frac{m^2}{H_{\text{inf}}^2}$$

g' : Gauge coupling [Meerburg and Pajer, JCAP 1302, 017 (2013)]

	$f_{\text{NL}}^{\text{local}}$	g'^2	H_{inf} [GeV]	m [GeV]	Y_k/M_{P}	$B(H_0^{-1}, t_0)$ [G]
(A)	2.70	1.13×10^{-5}	1.0×10^{13}	2.44×10^{12}	7.70×10^{-2}	7.15×10^{-64}
(B)	2.12×10^8	1.0×10^{-1}	1.0×10^{12}	2.44×10^{11}	7.70×10^{-2}	7.15×10^{-64}

$$\xi_k = 2.5590616$$

Planck result

$$f_{\text{NL}}^{\text{local}} = 2.5 \pm 5.7 \quad (68\% \text{ CL})$$

[Ade *et al.* [Planck Collaboration], arXiv:1502.01592]

V. Tensor-to-scalar ratio

Power spectrum of the curvature perturbation

$$\propto k^{n_s - 1} \quad n_s : \text{Spectral index}$$

Tensor-to-scalar ratio

$$r_{\text{TS}} \equiv \frac{\text{Power spectrum of the tensor mode}}{\text{Power spectrum of the scalar mode}}$$

Tensor-to-scalar ratio (2)

$$r_{\text{TS}} = 16\epsilon_V(t_k), \quad \epsilon(t_k) = \frac{2M_{\text{P}}^2 m^4 Y_k^2}{(2\bar{V} - m^2 Y_k)^2}$$

[Barnaby and Peloso, Phys. Rev. Lett. **106**, 181301 (2011)]

[Barnaby, Namba and Peloso, JCAP **1104**, 009 (2011)]

	r_{TS}	H_{inf} [GeV]	m [GeV]	Y_k/M_{P}
(A)	1.87×10^{-5}	1.0×10^{13}	2.44×10^{12}	7.70×10^{-2}
(B)	1.87×10^{-5}	1.0×10^{12}	2.44×10^{11}	7.70×10^{-2}

Planck result

$$r_{\text{TS}} < 0.11 \text{ (95% CL)} \quad \text{at} \quad k = 0.002 \text{Mpc}^{-1}$$

[Ade *et al.* [Planck Collaboration], arXiv:1502.02114]

Cf. [Ade *et al.* [Planck Collaboration], arXiv:1502.00612]

VI. Conclusions

- We have studied the generation of the large-scale magnetic fields from a kind of moduli inflation.
- We have first estimated the explicit values of three cosmological observables such as the current magnetic fields on the Hubble horizon, local non-Gaussianity, and the tensor-to-scalar ratio.
- The local non-Gaussianity and tensor-to-scalar ratio obtained in this model are consistent with the Planck results.

Acknowledgments

- The presenter would like to sincerely appreciate the significant discussions with Professor Tatsuo Kobayashi and Professor Osamu Seto and their kind important suggestions and comments.

Back up slides

Non-Gaussianity of curvature perturbations (4)

- If $\sigma_c \gg H$, the effect of the coupling between F_μ and φ on the resultant amplitude of the large-scale magnetic fields can be negligible.

[Bassett, Pollifrone, Tsujikawa and Viniegra, Phys. Rev. D 63, 103515 (2001)]

Axion monodromy inflation

$$V(Y) = AY^q, \quad q = 1$$

$$X = 1, (\text{i.e., } \Phi = 0)$$

[Kobayashi, Seto and Yamaguchi, PTEP 2014, 103C01 (2014)]

[Higaki, Kobayashi, Seto and Yamaguchi, JCAP 1410, 025 (2014)]

$$Y = \bar{Y}t, \quad \dot{\bar{Y}} = -\frac{A}{3H_{\inf}}$$

$$\ddot{F}_i(t, \mathbf{x}) + H\dot{F}_i(t, \mathbf{x}) - \frac{1}{a^2}\partial_j\partial_j F_i(t, \mathbf{x}) + \frac{g_{\text{ps}}}{M}\frac{1}{a}\frac{A}{3H_{\inf}}\epsilon^{ijk}\partial_j F_k(t, \mathbf{x}) = 0$$

$$\xi = -\frac{1}{6}\frac{g_{\text{ps}}}{M}\frac{A}{H_{\inf}^2}$$

Axion monodromy inflation (2)

Example

$$M = 3.55 \times 10^{18} \text{GeV}, \quad g_{\text{ps}} = 1.0$$

$$|\xi| = 2.98, \quad H_{\text{inf}} = 6.51 \times 10^{15} \text{GeV}$$

$$n_s = 0.9603$$

$$\longrightarrow \underline{\underline{r_{\text{TS}} = 16\epsilon_V = 0.106}}$$

This is consistent with BICEP2 result.

Power spectrum of the curvature perturbations

Evolution equation of quantum fluctuations of Y

$$\frac{\partial^2 \delta Y(t, \mathbf{x})}{\partial t^2} + 3H \frac{\partial \delta Y(t, \mathbf{x})}{\partial t} - \frac{\nabla^2 \delta Y(t, \mathbf{x})}{a^2} = \frac{g_{\text{ps}}}{M} F_{\mu\nu} \tilde{F}^{\mu\nu}$$

Two-point correlation function in the Fourier space

$$\langle \mathcal{R}_{\mathbf{k}} \mathcal{R}_{\mathbf{k}'} \rangle \equiv (2\pi^2/k^3) P_{\mathcal{R}}(k) \delta^{(3)}(\mathbf{k} + \mathbf{k}') \quad \mathcal{R} = -\left(H/\dot{Y}\right) \delta Y$$

$$P_{\mathcal{R}}(k) \simeq \Delta_{\mathcal{R}}^2 \left(\frac{k}{k_*}\right)^{n_s-1} \left(1 + \Delta_{\mathcal{R}}^2 f_S(\xi) \exp(4\pi\xi)\right)$$

: Curvature
perturbations

$$\Delta_{\mathcal{R}}^2 = \left(\frac{H_{\text{inf}}}{2\pi}\right)^2 \frac{H_{\text{inf}}^2}{|\dot{Y}|^2} \quad , \quad k_* = 0.002 \text{ Mpc}^{-1}$$

[Barnaby and Peloso,
Phys. Rev. Lett. **106**,
181301 (2011)]

$$f_S(\xi) \cong 3.0 \times 10^{-5} \xi^{-5.4} \quad \text{for } 2 \leq \xi \leq 3$$

[Barnaby, Namba
and Peloso, JCAP
1104, 009 (2011)]

Normalization with COBE and Planck data

Slow-roll parameters: $\epsilon_V \equiv \frac{M_{\text{P}}^2}{2} \left(\frac{V'(Y)}{V(Y)} \right)^2, \quad \eta_V \equiv M_{\text{P}}^2 \frac{V''(Y)}{V(Y)}$

Spectral index: $n_s \simeq 1 + 6\epsilon_V + 2\eta_V$

With COBE and Planck data, we find

$$f_S(\xi) \exp(4\pi\xi) = \frac{25}{144} \times 10^8$$

$$Y_k = \pm \frac{M_{\text{P}}}{\sqrt{2}\beta} \left[4 \frac{\bar{V}}{M_{\text{P}}^2 m^2 \beta^{-2}} + 1 \pm \sqrt{12 \frac{\bar{V}}{M_{\text{P}}^2 m^2 \beta^{-2}} + 1} \right]^{1/2}$$

$$\beta \equiv \sqrt{\frac{-(n_s - 1)}{8}}$$

Normalization with COBE and Planck data (2)

For $m/H_{\text{inf}} \ll 1$, we obtain

$$m \approx \sqrt{6}\xi_k \frac{M}{M_{\text{P}}} X(t_k) H_{\text{inf}}$$

$$Y_k \approx \sqrt{6} M_{\text{P}} \frac{H_{\text{inf}}}{m} = \frac{M_{\text{P}}^2}{\xi_k X(t_k) M}$$

$$\xi_k \approx [Y_k / (6MX(t_k))] (m^2 / H_{\text{inf}}^2)$$

Cf.

$$\dot{Y}(t_{\text{R}}) = \frac{3}{2} \left[-1 + \sqrt{1 + \left(\frac{2m}{3H_{\text{inf}}} \right)^2} \right] H_{\text{inf}} Y_k \exp \left\{ \frac{3}{2} \left[-1 + \sqrt{1 + \left(\frac{2m}{3H_{\text{inf}}} \right)^2} \right] (N - 1) \right\}$$

Tensor-to-scalar ratio (4)

BICEP2 experiment

$$r_{\text{TS}} = 0.20^{+0.07}_{-0.05} \quad (68\% \text{ CL})$$

- **Planck result**

(Spectral index of power spectrum of the curvature perturbations)

$$n_s = 0.9603 \pm 0.0073 \text{ (68% CL)} \quad \text{at} \quad k = 0.05 \text{Mpc}^{-1}$$

[Ade *et al.* [Planck Collaboration], Astron. Astrophys. 571, A22 (2014)]

$$\text{Cf. } n_s = 0.968 \pm 0.006 \text{ (68% CL)} \quad \text{at} \quad k = 0.05 \text{Mpc}^{-1}$$

[Ade *et al.* [Planck Collaboration], arXiv:1502.02114]

- $\bar{V} = 3H_{\text{inf}}^2 M_P^2$: **Friedmann equation**

X の変動

$$X \equiv \exp(-\lambda\Phi/M_P)$$

$$\ddot{\Phi} + 3H\dot{\Phi} + \frac{dU(\Phi)}{d\Phi} = 0$$

$$\xrightarrow{\quad\quad\quad} 3H_{\text{inf}}\dot{\Phi} + dU(\Phi)/d\Phi = 0$$

↑

$$\left| \ddot{\Phi} / \left(H_{\text{inf}}\dot{\Phi} \right) \right| \ll 1$$

$$\rightarrow \text{解: } \Phi = \left(\lambda\kappa \right)^{-1} \ln \left[\lambda^2 w H_{\text{inf}} (t - t_{\text{R}}) + \exp \left(\lambda\kappa\Phi_{\text{R}} \right) \right]$$

→ 定性的に同様の結果が得られる。

I. Introduction

II. Model

III. Current strength of the magnetic fields

IV. Non-Gaussianity of curvature perturbations

V. Tensor-to-scalar ratio

VI. Conclusions

Origin of cosmic magnetic fields (1)

1. Astrophysical process: **Plasma instability**

(a) **Biermann battery mechanism**

[Biermann, Schlüter, Phys. Rev. (1951)]

[Hanayama *et al.*, ApJ (2005)]

(b) **Weibel instability**

[Weibel, PRL (1959)]

[Fujita, Kato, MNRAS (2005)]

Origin of cosmic magnetic fields (2)

2. Cosmolosical processes:

- **Phase transitions**

- (i) **Electroweak phase transition (EWPT)**

[Baym, Bödeker, McLerran, PRD (1996)]

- (ii) **Quark-hadron phase transition (QCDPT)**

[Quashnock, Loeb, Spergel, ApJ (1989)]

- **Density perturbations**

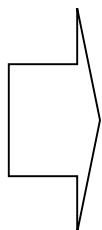

[Ichiki *et al.*, Science (2006)]

[Kobayashi, *et al.*, PRD (2007)]

Inflationary cosmology

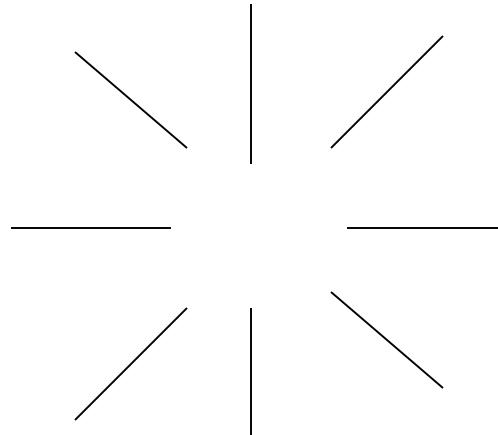

Inflation:

Exponential cosmic acceleration in the early universe

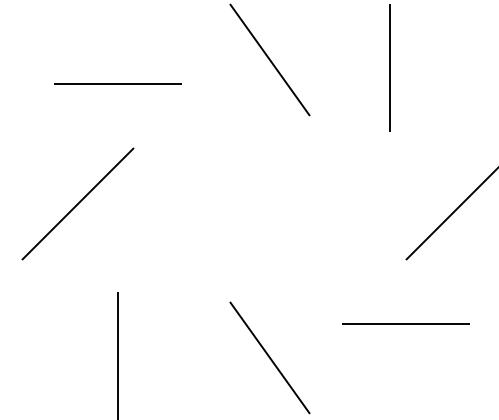

1. Homogeneity, Isotropy, Flatness
2. Primordial density perturbations

Tensor-to-scalar ratio (2)

E-mode polarization

B-mode polarization

Only from the tensor mode

[E. Komatsu, *The astronomical herald*,
The Astronomical Society of Japan, 2003]

IV. Non-Gaussianity of curvature perturbations

Einstein equation

→ Metric perturbation = Matter density perturbation

(1) Scalar mode (Curvature perturbation)

Temperature perturbation of the cosmic microwave background radiation (CMB): $\frac{\delta T}{T} \simeq 10^{-5}$

(2) Vector mode

(3) Tensor mode (Primordial gravitational wave)

V. Tensor-to-scalar ratio

Power spectrum of the curvature perturbation

$$\propto k^{n_s - 1} \quad n_s : \text{Spectral index}$$

Tensor-to-scalar ratio

$$r_{\text{TS}} \equiv \frac{\text{Power spectrum of the tensor mode}}{\text{Power spectrum of the scalar mode}}$$

Current strength of the magnetic fields (3)

- **The resultant strength of the magnetic fields satisfies the constraints suggested by the back reaction problem.**

[Demozzi, Mukhanov and Rubinstein, JCAP 0908, 025 (2009)]

Cf. [Kanno, Soda and Watanabe, JCAP 0912, 009 (2009)]

[Suyama and Yokoyama, Phys. Rev. D 86, 023512 (2012)]

[Fujita and Mukohyama, JCAP 1210, 034 (2012)]

[Fujita and Yokoyama, JCAP 1403, 013 (2014)]

- * **Observational constraints found from Planck**

$$B < 4.4 \text{ nG} \quad \text{on} \quad 1\text{Mpc}$$

[Ade *et al.* [Planck Collaboration], arXiv:1502.01594]

磁場の強度に対する制限

1. CMB

$$B < 5 \times 10^{-9} \text{G}$$

$$L = H_0^{-1}$$

[Barrow, Ferreira,
Silk, PRL (1997)]

2. BBN

$$B < 10^{-6} \text{G}$$

$$h_{70} \equiv h/0.70$$

$$L \sim 1.4 \times 10^{-4} h_{70}^{-1} \text{ Mpc}$$

[Grasso, Rubinstein, PLB (1996)] [Cheng, Olinto, Schramm, Truran, PRD (1996)]

3. ファラデー回転の Rotation measure (RM)

$$B < 6 \times 10^{-10} (n_{e0}/10^{-7} \text{ cm}^{-3})^{-1} \text{ G}$$

n_{e0} : 熱的電子の現在の平均密度

[Vallée, ApJ (1990)]

II B. 磁場の現在での強度

<固有磁場>

$$B_i^{\text{proper}}(t, x) = a^{-1} B_i(t, x) = a^{-2} \epsilon_{ijk} \partial_j A_k(t, x)$$

<Fourier 空間での磁場のエネルギー密度>

$$\rho_B(k, t) = \frac{1}{2} \left[|B_+^{\text{proper}}(k, t)|^2 + |B_-^{\text{proper}}(k, t)|^2 \right]$$

$$|B_{\pm}^{\text{proper}}(k, t)|^2 = \frac{1}{a^2} \left(\frac{k}{a} \right)^2 |A_{\pm}(k, t)|^2$$

$$B_{\pm}^{\text{proper}}(k, t) \equiv B_1^{\text{proper}}(k, t) \pm i B_2^{\text{proper}}(k, t)$$

$\rho_B(k, t)$ に
相空間密度:
 $4\pi k^3 / (2\pi)^3$
をかける。

<磁場のエネルギー密度>

$$\rho_B(L, t) = \frac{k^3}{4\pi^2} \left[|B_+^{\text{proper}}(k, t)|^2 + |B_-^{\text{proper}}(k, t)|^2 \right] \leftarrow$$

$$\rho_B(L, t) = \frac{1}{8\pi^2} \left(\frac{k}{a} \right)^4 \underline{\mathcal{I}(k, t)}, \quad \mathcal{I}(k, t) \equiv |C_+(k, t)|^2 + |C_-(k, t)|^2$$

インフレーション期での増幅項

現在の磁場の強度

$$B_Y^{\text{proper}}(t, \mathbf{x}) = \frac{1}{a^2} B_{Yi}(t, \mathbf{x}) = \frac{1}{a^2} \epsilon_{ijk} \partial_j F_k(t, \mathbf{x})$$

$$E_Y^{\text{proper}}(t, \mathbf{x}) = a^{-1} E_{Yi}(t, \mathbf{x}) = -a^{-1} \dot{F}_i(t, \mathbf{x})$$

$$\rho_{B_Y}(L, t) = \frac{k^3}{4\pi^2} \left[|B_{Y+}^{\text{proper}}(k, t)|^2 + |B_{Y-}^{\text{proper}}(k, t)|^2 \right] X$$

$$|B_{Y\pm}^{\text{proper}}(k, t)|^2 = (1/a^2) (k/a)^2 |F_\pm(k, t)|^2$$

→ $B(L, t) = \sqrt{2\rho_B(L, t)}$ を用いる。

$$B(L, t_0) = 8.2 \times 10^{18} \exp(-2N) \left(\frac{H_{\text{inf}}}{[\text{GeV}]} \right)^2 \left(\frac{a_R}{a_0} \right)^2 \sqrt{\mathcal{I}(k, t_R)} \quad [\text{G}]$$

$$N = 45 + \ln \left(\frac{L}{[\text{Mpc}]} \right) + \ln \left\{ \frac{[30/(\pi^2 g_R)]^{1/12} \rho_R^{1/4}}{10^{38/3} [\text{GeV}]} \right\} \quad : \quad t_1 \text{ と } t_R \text{ の間の } e\text{-folds 数}$$

$$\rho_R = \frac{\pi^2}{30} g_R T_R^4 \quad : t_R \text{ での輻射のエネルギー密度,} \quad T_R : t_R \text{ での温度}$$

$$\frac{a_R}{a_0} = \left(\frac{g_R}{3.91} \right)^{-1/3} \frac{T_{\gamma 0}}{T_R}$$

$$T_{\gamma 0} (= 2.73[\text{K}]) : \text{現在の温度}$$

$$g_R (\approx 100) : t_R \text{ での相対論的粒子の全自由度数}$$
